## Chapter Goals

- To learn about the architecture of computers
- To learn about machine languages and higher-level programming languages
- To become familiar with your compiler
- To compile and run your first C++ program
- To recognize compile-time and run-time errors
- To describe an algorithm with pseudocode
- To understand the activity of programming

C++ for Everyone by Cay Horstmann

## What Is Programming?

You have probably used a computer for work or fun.

Many people use computers for everyday tasks such as electronic banking or writing a term paper.

Computers are good for such tasks.

They can handle repetitive chores, such as totaling up numbers or placing words on a page, without getting bored or exhausted.

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## What Is Programming?

Computers can carry out a wide range of tasks because they execute different **programs**, each of which directs the computer to work on a specific task.

The computer itself is a machine that stores data (numbers, words, pictures), interacts with devices (the monitor, the sound system, the printer), and executes programs.

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## What Is Programming?

A **computer program** tells a computer, in minute detail, the sequence of steps that are needed to fulfill a task.

### Hardware

The physical computer and peripheral devices are collectively called the **hardware**.

### Software

The programs the computer executes are called the **software**.

C++ for Everyone by Cay Horstmann

## What Is Programming?

Programming  
is the act of designing and  
implementing computer programs.

C++ for Everyone by Cay Horstmann

### The Anatomy of a Computer – The CPU

- The CPU (central processing unit)
  - heart of the computer
  - executes one operation at a time
  - performs program control and data processing

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

### The Anatomy of a Computer – The CPU

- The CPU
  - carries out arithmetic operations such as addition, subtraction, multiplication, and division
  - fetches data from external memory or devices and stores data back.
- All data must travel through the CPU whenever it is moved from one location to another.

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

### The Anatomy of a Computer – The CPU

- The computer stores data and programs in memory
  - Primary memory - memory chips
    - Random access memory (RAM) (read-write memory)
    - Read-only memory (ROM)
  - Secondary storage devices
    - disk drives
    - CDs

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

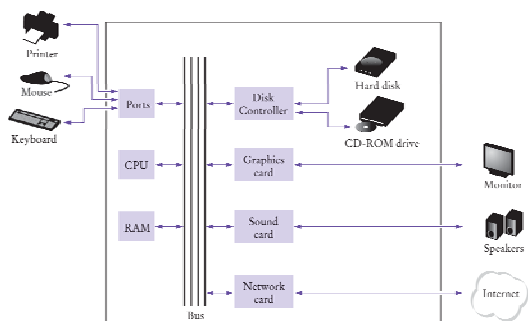

### The Anatomy of a Computer – Peripheral Devices

- The *user* is the human using a program that a programmer wrote.
- The computer transmits information (called *output*) to the user through a display screen, speakers, and printers.
- The user can enter information (called *input*) for the computer by using a keyboard or a pointing device such as a mouse.

C++ for Everyone by Cay Horstmann

## What Is a Computer?

The Electronic Numerical Integrator And Computer  
(The ENIAC)

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Machine Code and Programming Languages

- Computer programs are stored as machine instructions in a code that depends on the processor type.
- A typical sequence of machine instructions is
  - 1. Move the contents of memory location 40000 into the CPU.
  - 2. If that value is > 100, continue with the instruction that is stored in memory location 11280.

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Machine Code and Programming Languages

- Machine instructions are encoded as numbers so that they can be stored in memory.
- On a Pentium processor, this sequence of instructions from the previous slide is encoded as the sequence of numbers

161 40000 45 100 127 11280

- On a processor from a different manufacturer, the encoding would be different.

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## High-Level Languages and the Compiler

- High-level languages like C++ are independent of the processor type and hardware. They will work equally well:
  - on an Intel Pentium and a processor
  - in a cell phone
- The compiler
  - a special computer program, that translates the higher-level description (a program) into machine instructions for a particular processor.
- Low-level language: the machine code for a specific CPU
  - the compiler-generated machine instructions are different, but the programmer who uses the compiler need not worry about these differences.

C++ for Everyone by Cay Horstmann

## The Evolution of C++

- Ancient history (pre 1972)
- C (1972)
- ANSI Standard C (1989)
- Meanwhile, Bjarne Stroustrup of AT&T adds features of the language Simula (an object-oriented language designed for carrying out simulations) to C resulting in:
- C++ (1985)

C++ for Everyone by Cay Horstmann

## The Evolution of C++

- Ancient history (pre 1972)
- C (1972)
- ANSI Standard C (1989)
- Meanwhile, Bjarne Stroustrup of AT&T adds features of the language Simula (an object-oriented language designed for carrying out simulations) to C resulting in:
- C++ (1985)
- ANSI Standard C++ (1998)
- ANSI Standard C++ [revised] (2003)
- The present C++
  - a general-purpose language that is in widespread use for systems and embedded
  - the most commonly used language for developing system software such as databases and operating systems

... the future: another Standard (2010?)

C++ for Everyone by Cay Horstmann

## Becoming Familiar with Your Programming Environment

- You will need to know how to log in (if needed),
- and, how to start your C++ development environment. An **IDE** (integrated development environment) is where you will most likely work.

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Becoming Familiar with Your Programming Environment

- You will become a typist because you will use an editor to type your C++ programs into the IDE. Your program is called a source file.

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Becoming Familiar with Your Programming Environment

- You will need to learn how to compile and run your program in the IDE.

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Becoming Familiar with Your Programming Environment

- There's a lot going on behind the scenes in the IDE that you don't normally see:

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Becoming Familiar with Your Programming Environment

- The compiler translates C++ programs into machine code.

- The linker combines machine code with library code into an executable program.

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## The Edit-Compile-Run Loop

This process reflects the way programmers work

(shown as a flowchart)

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Becoming Familiar with Your Programming Environment

- You will need to know your computer's file system: files, folders, and extensions. C++ program files typically have the extension: .cpp (or .cc or .cxx or even .C).
- You should be organized by creating folders for organizing your files.

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Becoming Familiar with Your Programming Environment

and  
you MUST know:

1. HOW TO BACK UP YOUR WORK.
2. HOW TO SAVE YOUR WORK (same thing as backing up your work).
3. HOW TO SAVE YOUR WORK BY BACKING IT UP (repeated so you will know this is very important).

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Becoming Familiar with Your Programming Environment

And, finally...

C++ for Everyone by Cay Horstmann

## Analyzing Your First Program

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Analyzing Your First Program

- At this point we will analyze the classic first program that everyone writes: Hello World!
  - (yes, everyone who is anyone started with this one)
- Its job is to write the words Hello World! on the screen.

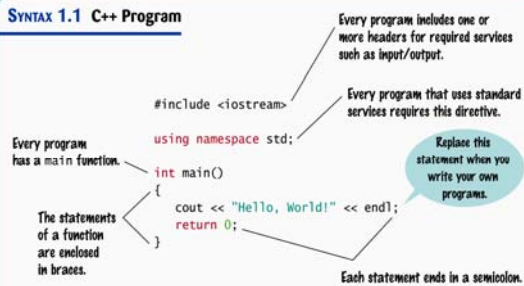

```
1 #include <iostream>
2
3 using namespace std;
4
5 int main()
6 {
7     cout << "Hello, World!" << endl;
8     return 0;
9 }
```

ch01/hello.cpp

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Analyzing Your First Program

### SYNTAX 1.1 C++ Program

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Analyzing Your First Program

- The first line tells the compiler to include a service for "stream input/output". Later you will learn more about this but, for now, just know it is needed to write on the screen.

```
1 #include <iostream>
2
3 using namespace std;
4
5 int main()
6 {
7     cout << "Hello, World!" << endl;
8     return 0;
9 }
```

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Analyzing Your First Program

- The second line tells the compiler to use the "standard namespace". Again more later but for now, this is used in conjunction with the first line to output – and we certainly want "standard" output – nothing fancy yet.

```
1 #include <iostream>
2
3 using namespace std;
4
5 int main()
6 {
7     cout << "Hello, World!" << endl;
8     return 0;
9 }
```

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Analyzing Your First Program

- The next set of code *defines* a **function**. The name of this function is **main**.

```
1 #include <iostream>
2
3 using namespace std;
4
5 int main()
6 {
7     cout << "Hello, World!" << endl;
8     return 0;
9 }
```

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Analyzing Your First Program

- The **main** function "returns" an "integer" (that is, a whole number without a fractional part, called **int** in C++) with value 0. This value indicates that the program finished successfully.

```
1 #include <iostream>
2
3 using namespace std;
4
5 int main()
6 {
7     cout << "Hello, World!" << endl;
8     return 0;
9 }
```

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Analyzing Your First Program

- To show output on the screen, we use an entity called **cout**.
- What you want seen on the screen is "sent" to the **cout** entity using the **<<** operator (sometimes called the insertion operator): **<< "Hello, World!"**

```
1 #include <iostream>
2
3 using namespace std;
4
5 int main()
6 {
7     cout << "Hello, World!" << endl;
8     return 0;
9 }
```

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Analyzing Your First Program

- You can display more than one thing by re-using the << operator: << "Hello, World!" << endl;

```
1 #include <iostream>
2
3 using namespace std;
4
5 int main()
6 {
7     cout << "Hello, World!" << endl;
8     return 0;
9 }
```

ch01/hello.cpp  
C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Analyzing Your First Program

The output statement

```
cout << "Hello World!" << endl;
```

is an *output statement*.

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Analyzing Your First Program

The output statement

```
cout << "Hello World!" << endl;
```

- To display values on the screen, you send them to an entity called `cout`.

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Analyzing Your First Program

The output statement

```
cout << "Hello World!" << endl;
```

- To display values on the screen, you send them to an entity called `cout`.
- The << operator denotes the "send to" command.

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Analyzing Your First Program

```
cout << "Hello World!" << endl;
```

- "Hello World!" is called a *string*.
- You must put those double-quotes around strings.
- The `endl` symbol denotes an *end of line* marker which causes the cursor to move to the next screen row.

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Analyzing Your First Program

- Each statement in C++ ends in a semicolon.

```
1 #include <iostream>
2
3 using namespace std;
4
5 int main()
6 {
7     cout << "Hello, World!" << endl;
8     return 0;
9 }
```

ch01/hello.cpp  
C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Errors

ARGH!!!!

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Common Error – Omitting Semicolons

Common error  
Omitting a semicolon (or two)

Oh No!

```
1 #include <iostream>
2
3 using namespace std;
4
5 int main()
6 {
7     cout << "Hello, World!" << endl
8     return 0;
9 }
```

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Errors

Without that semicolon you actually wrote:

```
7 cout << "Hello, World!" << endl return 0;
8 }
```

which thoroughly confuses the compiler!

This is a *compile-time error* or *syntax error*.

A syntax error is a part of a program that does not conform to the rules of the programming language.

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Errors

Suppose you (accidentally of course) wrote:

```
cot << "Hello World!" << endl;
```

- This will cause a compile-time error and the compiler will complain that it has no clue what you mean by cot. The exact wording of the error message is dependent on the compiler, but it might be something like "Undefined symbol cot".

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Errors – How Many Errors?

- The compiler will not stop compiling, and will most likely list lots and lots of errors that are caused by the first one it encountered.
- You should fix only those error messages that make sense to you, starting with the first one, and then recompile (after SAVING, of course!).

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Errors

C++

- has *free-form layout*
- ```
int main(){cout<<"Hello, World!"<<endl;return 0;}
```
- will work (but is practically impossible to read)  
A good program is readable.

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Errors

Consider this:

```
cout << "Hollo, World!" << endl;
```

- *Logic errors* or *run-time errors* are errors in a program that compiles (the syntax is correct), but executes without performing the intended action.

not really an error?

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Errors

```
cout << "Hollo, World!" << endl;
```

- No, the programmer is responsible for inspecting and testing the program to guard against logic errors.

really an error!

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Errors

Some kinds of run-time errors are so severe that they generate an *exception*: a signal from the processor that aborts the program with an error message.

For example, if your program includes the statement

```
cout << 1 / 0;
```

your program may terminate with a “divide by zero” exception.

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Errors

- Every C++ program must have one and only one **main** function.
- Most C++ programs contain other functions besides **main** (more about functions later).

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Errors

C++

- is *case sensitive*. Typing:

```
int Main()
```

will compile but will not link.

A link-time error occurs here when the linker cannot find the **main** function – because you did not define a function named **main**. (**Main** is fine as a name but it is not the same as **main** and there has to be one **main** somewhere.)

C++ for Everyone by Cay Horstmann

## Describing an Algorithm with Pseudocode

### Pseudocode

- An informal description
- Not in a language that a computer can understand, but easily translated into a high-level language (like C++).

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Describing an Algorithm with Pseudocode

The method described in pseudocode must be

- Unambiguous
  - There are precise instructions for what to do at each step
  - and where to go next.
- Executable
  - Each step can be carried out in practice.
- Terminating
  - It will eventually come to an end.

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Describing an Algorithm with Pseudocode

Consider this problem:

- You have the choice of buying two cars.
- One is more fuel efficient than the other, but also more expensive.
- You know the price and fuel efficiency (in miles per gallon, mpg) of both cars.
- You plan to keep the car for ten years.
- Assume a price of gas is \$4 per gallon and usage of 15,000 miles per year.
- You will pay cash for the car and not worry about financing costs.

Which car is the better deal?

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Algorithms

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

### Describing an Algorithm with Pseudocode

#### Step 1 Determine the inputs and outputs.

In our sample problem, we have these inputs:

- *purchase price1* and *fuel efficiency1*  
the price and fuel efficiency (in mpg) of the first car
- *purchase price2* and *fuel efficiency2*  
the price and fuel efficiency of the second car

We simply want to know which car is the better buy.  
That is the desired output.

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

### Describing an Algorithm with Pseudocode

#### Step 2 Break down the problem into smaller tasks.

What will we do for **each** car?

1. The total cost for a car is  
*purchase price + operating cost*
2. We assume a constant usage and gas price for ten years, so the operating cost depends on the cost of driving the car for one year.  
The operating cost is  
*10 x annual fuel cost*
3. The annual fuel cost is  
*price per gallon x annual fuel consumed*
4. The annual fuel consumed is  
*annual miles driven / fuel efficiency*

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

### Describing an Algorithm with Pseudocode

#### Step 3 Describe each subtask in pseudocode.

You will need to arrange the steps so that any intermediate values are computed before they are needed in other computations.

For each car, compute the total cost as follows:

```
annual fuel consumed = annual miles driven / fuel efficiency
annual fuel cost = price per gallon x annual fuel consumed
operating cost = 10 x annual fuel cost
total cost = purchase price + operating cost
```

If *total cost1 < total cost2*

Choose *car1*

Else

Choose *car2*

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

### Algorithms

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

### Describing an Algorithm with Pseudocode

#### Step 4 Test your pseudocode by working a problem.

Use these sample values:

- Car 1: \$25,000, 50 miles/gallon
- Car 2: \$20,000, 30 miles/gallon

FIRST CAR:

```
annual fuel consumed = 1500 / 50 = 300
annual fuel cost = 4 x 300 = 1200
operating cost = 10 x 1200 = 12000
total cost = 25000 + 12000 = 37000
```

SECOND CAR:

(let's assume you can do the math) *total cost = 40000*

If *total cost1 < total cost2* ...

The algorithm says: choose the FIRST CAR

C++ for Everyone by Cay Horstmann

### Chapter Summary

#### Define "computer program" and programming.

- Computers execute very basic instructions in rapid succession.
- A computer program is a sequence of instructions and decisions.
- Programming is the act of designing and implementing computer programs.

#### Describe the components of a computer.

- The central processing unit (CPU) performs program control and data processing.
- Storage devices include memory and secondary storage.

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Chapter Summary

### Describe the process of translating high-level languages to machine code.

- Computer programs are stored as machine instructions in a code that depends on the processor type.
- C++ is a general-purpose language that is in widespread use for systems and embedded programming.
- High-level programming languages are independent of the processor.

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Chapter Summary

### Become familiar with your C++ programming environment.

- Set aside some time to become familiar with the programming environment that you will use for your class work.
- An editor is a program for entering and modifying text, such as a C++ program.
- C++ is case sensitive. You must be careful about distinguishing between upper and lowercase letters.
- Develop a strategy for keeping backup copies of your work before disaster strikes.

- The compiler translates C++ programs into machine code.
- The linker combines machine code with library code into an executable program.

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Chapter Summary

### Describe the building blocks of a simple program.

- Every C++ program contains a function called **main**.
- Use **cout** and the **<<** operator to display values on the screen.
- Enclose text strings in quotation marks.
- Use **+** to add two numbers and **\*** to multiply two numbers.
- Send **endl** to **cout** to end a line of displayed output.
- End each statement with a semicolon.

### Write pseudocode for simple algorithms.

- Pseudocode is an informal description of a sequence of steps for solving a problem.
- An algorithm for solving a problem is a sequence of steps that is unambiguous, executable, and terminating.

C++ for Everyone by Cay Horstmann  
Copyright © 2012 by John Wiley & Sons. All rights reserved

## Chapter Summary

### Classify program errors as compile-time and run-time errors.

- A compile-time error is a violation of the programming language rules that is detected by the compiler.
- A run-time error causes a program to take an action that the programmer did not intend.
- The programmer is responsible for inspecting and testing the program to guard against run-time errors.

C++ for Everyone by Cay Horstmann
