MC9S12C32
Device User Guide
V01.14

Original Release Date: 25 JUL 2001
Revised: 07 FEBRUARY 2003

Freescale Semiconductor, Inc.

Revision History

Version Number	Revision Date	Effective Date	Author	Description of Changes
0.1	25.JUL.01	25.JUL.01		Original Version
V00.02	01 AUG 01	01 AUG 01		Corrected subscripted pin names. Corrected MOD to MODC in pin list table Corrected TIM Module address range Removed detailed XTAL, EXTAL pin descriptions (part of CRG) Moved TPM Module base address Moved TPM vector addresses Various minor corrections
V00.03	07 AUG 2001	07 AUG 2001		Updated device name. Updated 80-pin package pinout as of Prod. Prop. Rev. 0.7 Added non_cust tags. Added App. A eletricals: ATD, NVM, CRG, CAN, SPI, EXT. Added App. B. Minor cleanup.
V00.04	19 SEP 2001	19 SEP 2001		Replaced TPM with PWM Minor corrections
V00.05	24SEP 2001	11 OCT 2001		Reset pin description, Reset interrupt description. Added PWM emergency shutdown to DUG features list Modified recommended PCB Layout for 52 LQFP Added PWM shutdown vector, deleted 2 incorrect vector sources Changed "STAR12" references to "HCS12"
V00.06	24SEP 2001	09 NOV 2001		Changed MSCAN interrupt enable names. Added mechanical package informationor 48LQFP and 52LQFP Updated user guide version references in Preface Added ROMONE pin description Moved non bonded pin initialization info from PIM to user guide. Corrected typos
V00.07	08 JAN 2002	08 JAN 2002		Added power domain map to I/O pin list Changed PortP KWU interrupt vector to $FF8E
V00.08	24 JAN 2002	24 JAN 2002		Enhanced PortP6, ROMON signal description Corrected revision date
V01.00	08 MAR 2002	08 MAR 2002		Updated block user guide version references Included 3V ATD range electricals Revised output driver strengths. Updated power consumption/dissipation and thermal properties
V01.01	22 MAR 2002	22 MAR 2002		Updated Flash electricals, removed NDA labels
V01.02	13 MAY 2002	13 MAY 2002		Updated Flash W/E spec.
V01.03	10 JUN 2002	10 JUN 2002		Added 3.3V range I/O parameters
V01.04	14 JUN 2002	15 JUN 2002		Preface Section Table corrections
V01.05	21 JUN 2002	21 JUN 2002		Changed 5V range to 5V+/-10% in electrical parameter tables Added ATD 8-bit resolution accuracy parameters Added general comment for range 3.6V to 4.5V

Version Number	Revision Date	Effective Date	Author	Description of Changes
V01.06	09 JULY 2002	09 JULY 2002		Updated SPI electrical parameters Corrected interrupt enable register/bit names
V01.07	25JULY 2002	25JULY 2002		Included register map listing in overview. Added parameter classification column to electrical parameter tables.
V01.08	01 AUG. 2002	01 AUG. 2002		Created new Printed Circuit Board Section. Updated formats
V01.09	24 SEP 2002	24 SEP. 2002		Corrected register name errors in memory map summary
V01.10	10 OCT 2002	10 OCT 2002		Corrected PK7 reference to PP6 Included OSC user guide reference
V01.11	04 NOV 2002	04 NOV 2002		Removed incorrect reference to RESET pin pullup. Corrected 3V+/- 10% to 3.3V +/- 10% in exp.bus timing table. Added VREG electricals to appendix.
V01.12	19 DEC 2002	19 DEC 2002		Corrected INITEE register contents Corrected WAIT current in electrical parameters Changed recommended VREG capacitor values
V01.13	23 JAN 2003	23 JAN 2003		Changed ROMONE pin references to ROMCTL Preface Table 0-2 updates Added BDM alternate clock clarification Corrected footnote in PLL electrical parameter table Corrections to detailed register map. Enhanced section 4.3.3 "Unsecuring the microcontroller" Updated Part ID Table
V01.14	07 FEB 2003	07 FEB 2003		Corrected PE[1:0] Pull specification in signal property table Enhanced description of Partnumber encoding in preface

Preface

The Device User Guide provides information about the MC9S12C32 device made up of standard HCS12 blocks and the HCS12 processor core. This document is part of the customer documentation. A complete set of device manuals also includes the HCS12 Core User Guide and all the individual Block User Guides of the implemented modules. In a effort to reduce redundancy all module specific information is located only in the respective Block User Guide. If applicable, special implementation details of the module are given in the block description sections of this document

Table 0-1 Derivative Differences

Generic device	MC9S12C32	MC9S12C32	MC9S12C32
Part Numbers	MC9S12C32	MC9S12C32	MC9S12C32
Package	80QFP	52LQFP	48LQFP
Mask set	L45J	L45J	L45J
Temp. Options	M, V, C	M, V, C	M, V, C

Notes: C: T_A = 85$^-$C, f = 25MHz. V: T_A=105$^-$C, f = 25MHz. M: T_A= 125$^-$C, f = 25MHz

Section 1 Introduction

1.1 Overview

The MC9S12C32 is a 48/52/80 pin Flash-based Industrial/Automotive network control MCU, comprised of standard on-chip peripherals including a 16-bit central processing unit (HCS12 CPU), 32K bytes of Flash EEPROM, 2K bytes of RAM, an asynchronous serial communications interface (SCI), a serial peripheral interface (SPI), an 8-channel 16-bit timer module (TIM), a 6-channel 8-bit Pulse Width Modulator (PWM), an 8-channel, 10-bit analog-to-digital converter (ADC) and a CAN 2.0 A, B software compatible module (MSCAN). Furthermore, an on chip bandgap based voltage regulator (VREG) generates the internal digital supply voltage (VDD) for a 3 V to 5.5V external supply range. The MC9S12C32 has full 16-bit data paths throughout. The inclusion of a PLL circuit allows power consumption and performance to be adjusted to suit operational requirements. A total of 50 I/O port pins and 2 input pins are available in the 80 pin package version. Furthermore, up to 12 I/O port bits are available with Wake-Up capability from STOP or WAIT mode.

1.2 Features

- 16-bit HCS12 CORE
  - HCS12 CPU
    i. Upward compatible with M68HC11 instruction set
    ii. Interrupt stacking and programmer's model identical to M68HC11
    iii. Instruction queue
    iv. Enhanced indexed addressing
  - MMC (memory map and interface)
  - INT (interrupt control)
  - BDM (background debug mode)
  - DBG12 (enhanced debug12 module, backwardly compatible with BKP breakpoint module)
  - MEBI : Multiplexed Expansion Bus Interface (available only in 80 pin package version)
- Wake-up interrupt inputs
  - Up to 12-port bits available for wake up interrupt function with digital filtering
- Memory
  - 32K Byte Flash EEPROM (erasable in 512-byte sectors)
  - 2K Byte RAM
- Analog-to-Digital Converters
  - One 8-channel module with 10-bit resolution.
  - External conversion trigger capability

- One 1M bit per second, CAN 2.0 A, B software compatible modules

    – Five receive and three transmit buffers

    – Flexible identifier filter programmable as 2 x 32 bit, 4 x 16 bit or 8 x 8 bit

    – Four separate interrupt channels for Rx, Tx, error and wake-up

    – Low-pass filter wake-up function

    – Loop-back for self test operation

- Timer Module (TIM)

    – 8-Channel Timer

    – Each Channel Configurable as either Input Capture or Output Compare

    – Simple PWM Mode

    – Modulo Reset of Timer Counter

    – 16-Bit Pulse Accumulator

    – External Event Counting

    – Gated Time Accumulation

- 6 PWM channels

    – Programmable period and duty cycle

    – 8-bit 6-channel or 16-bit 3-channel

    – Separate control for each pulse width and duty cycle

    – Center-aligned or left-aligned outputs

    – Programmable clock select logic with a wide range of frequencies

    – Fast emergency shutdown input

- Serial interfaces

    – One asynchronous serial communications interface (SCI)

    – One synchronous serial peripheral interface (SPI)

- CRG (Clock Reset Generator Module)

    – Windowed COP watchdog,

    – Real time interrupt,

    – Clock monitor,

    – Pierce or low current Colpitts oscillator

    – Phase-locked loop clock frequency multiplier

    – Limp home mode in absence of external clock

    – Low power 0.5 to 16 MHz crystal oscillator reference clock

- Operating frequency
  - 25MHz Bus Speed
- Internal 2.5V Regulator
  - Supports an input voltage range from 2.97V to 5.5V
  - Low power mode capability
  - Includes low voltage reset (LVR) circuitry
  - Includes low voltage interrupt (LVI) circuitry
- 48-Pin LQFP, 52-Pin LQFP or 80-Pin QFP package
  - Up to 58 I/O lines with 5V input and drive capability (80 pin package)
  - Up to 2 dedicated 5V input only lines (IRQ, XIRQ)
  - 5V 8 A/D converter inputs and 5V I/O
- Development support
  - Single-wire background debug™ mode (BDM)
  - On-chip hardware breakpoints
  - Enhanced DBG12 debug features

1.3 Modes of Operation

User modes **(Expanded modes are only available in the 80 pin package version)**.

- Mormal and Emulation Operating Modes
  - Normal Single-Chip Mode
  - Normal Expanded Wide Mode
  - Normal Expanded Narrow Mode
  - Emulation Expanded Wide Mode
  - Emulation Expanded Narrow Mode
- Special Operating Modes
  - Special Single-Chip Mode with active Background Debug Mode
  - Special Test Mode **(Motorola use only)**
  - Special Peripheral Mode **(Motorola use only)**

Low power modes

- Stop Mode
- Pseudo Stop Mode
- Wait Mode

1.4 Block Diagram

Figure 1-1 MC9S12C32 Block Diagram

Signals shown in **Bold** are not available on the 52 or 48 Pin Package
Signals shown in **_Bold Italic_** are available in the 52, but not the 48 Pin Package

Internal Logic 2.5V
VDD1,2
VSS1,2

I/O Driver 5V
VDDX
VSSX

PLL 2.5V
VDDPLL
VSSPLL

A/D Converter 5V
VDDA
VSSA
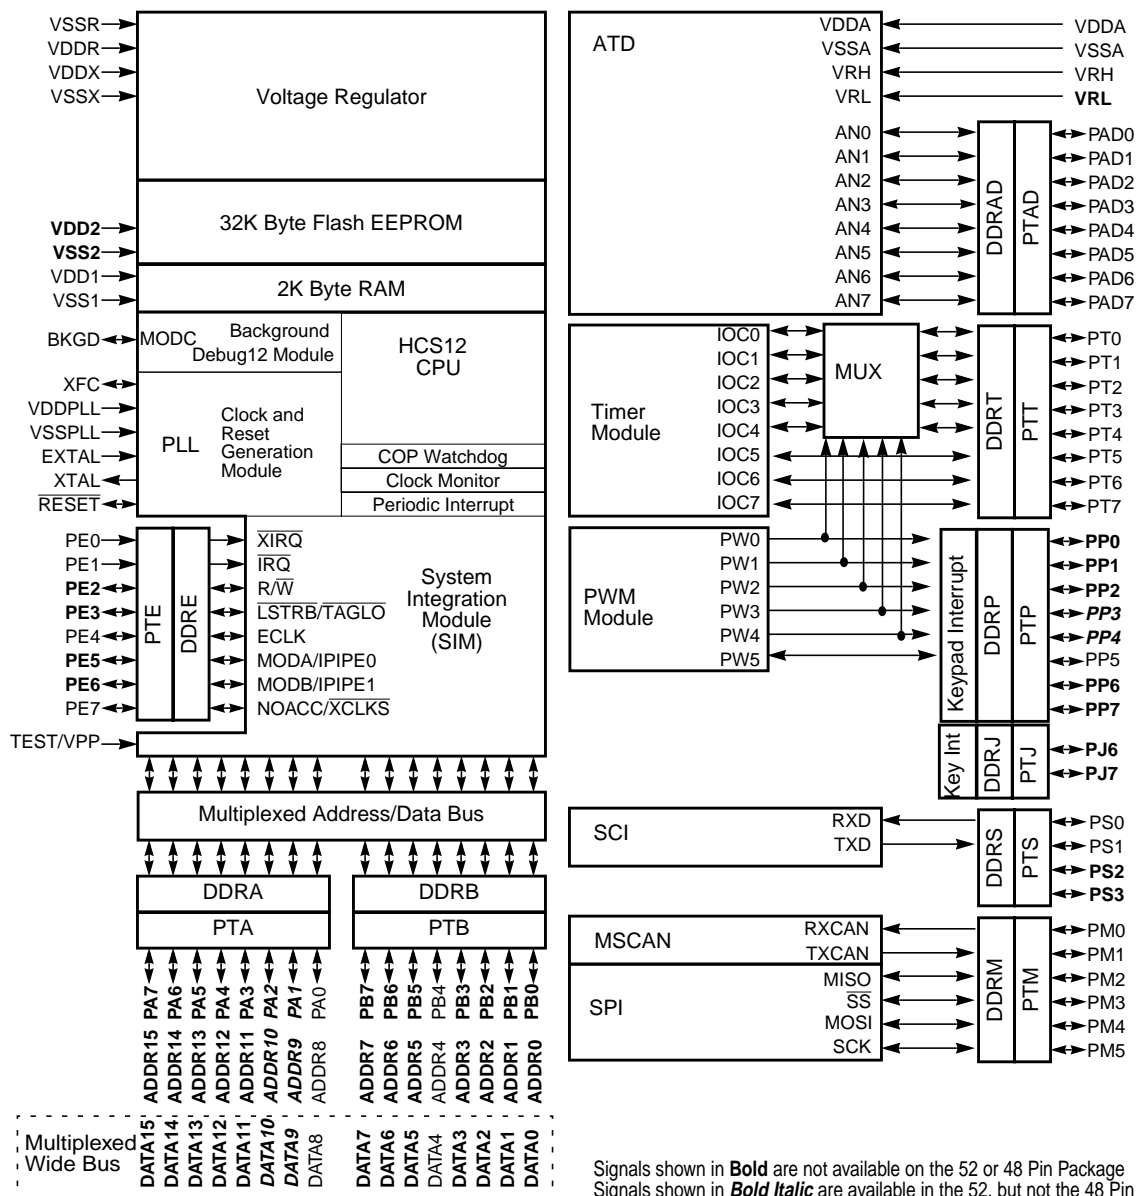

VRL is bonded internally to VSSA
for 52 and 48 Pin packages

Voltage Regulator 5V & I/O
VDDR
VSSR

1.5 Device Memory Map

and **Figure 1-2** show the device memory map of the MC9S12C32 after reset.

Table 1-1 Device Memory Map

Address	Module	Size
$000 - $017	CORE (Ports A, B, E,Modes, Inits, Test)	24
$018	Reserved	1
$019	Voltage Regulator (VREG)	1
$01A - $01B	Device ID register	2
$01C - $01F	CORE (MEMSIZ, IRQ, HPRIO)	4
$020 - $02F	CORE (DBG)	16
$030 - $033	CORE (PPAGE[1])	4
$034 - $03F	Clock and Reset Generator (CRG)	12
$040 - $06F	Standard Timer Module16-bit 8-channels (TIM)	48
$070 - $07F	Reserved	16
$080 - $09F	Analog to Digital Convert (ATD)	32
$0A0 - $0C7	Reserved	40
$0C8 - $0CF	Serial Communications Interface (SCI)	8
$0D0 - $0D7	Reserved	8
$0D8 - $0DF	Serial Peripheral Interface (SPI)	8
$0E0 - $0FF	Pulse Width Modulator 8-bit 6 channels (PWM)	32
$100 - $10F	Flash Control Register	16
$110 - $13F	Reserved	48
$140 - $17F	Motorola Scalable CAN (MSCAN)	64
$180 - $23F	Reserved	192
$240 - $27F	Port Integration Module (PIM)	64
$280 - $3FF	Reserved	384
$0800 - $0FFF	2K RAM Array	2048
$8000 - $FFFF	32K Fixed Flash EEPROM Array	32768

NOTES:

1. External memory paging is not supported on this device (**6.1.1 PPAGE**).

Figure 1-2 MC9S12C32 Memory Map

Address	Description
$0000 – $03FF	1K Register Space (Mappable to any 2k Block within the first 32K)
$0800 – $0FFF	2K BytesRAM (Mappable to any 2K boundary)
$4000 – $7FFF	16K Fixed Flash EEPROM block 1 For reset state (ROMHM=0)
$8000 – $BFFF	16K Page Window Fixed Flash EEPROM block 1 visible at reset
$C000 – $FFFF	16K Fixed Flash EEPROM block 2
	2K, 4K, 8K or 16K Protected Boot Sector

EXPANDED

NORMAL SINGLE CHIP

SPECIAL SINGLE CHIP

NOTE: The same Flash block is visible at reset in both $4000-$7FFF and $8000-$BFFF ranges

NOTE: Expanded Modes are only available in the 80 pin QFP package version

1.6 Detailed Register Map

1.7 Part ID Assignments

The part ID is located in two 8-bit registers PARTIDH and PARTIDL (addresses $001A and $001B after reset). The read-only value is a unique part ID for each revision of the chip. **Table 1-3** shows the assigned part ID number.

Table 1-3 Assigned Part ID Numbers

Device	Mask Set Number	Part ID[1]
MC9S12C32	**0L45J**	$3300
MC9S12C32	**1L45J**[2]	$3300

NOTES:

1. The coding is as follows:
Bit 15-12: Major family identifier
Bit 11-8: Minor family identifier
Bit 7-4: Major mask set revision number including FAB transfers
Bit 3-0: Minor - non full - mask set revision
2. Both Masksets 0L45J and 1L45J use the same Part ID number.

The device memory sizes are located in two 8-bit registers MEMSIZ0 and MEMSIZ1 (addresses $001C and $001D after reset). **Table 1-4** shows the read-only values of these registers. Refer to section Module Mapping and Control (MMC) of HCS12 Core User Guide for further details.

Table 1-4 Memory size registers

Register name	Value[1]
MEMSIZ0	$00
MEMSIZ1	$80

NOTES:

1. Since no paging is supported on the MC9S12C32, only a 64K range is accessible.

Section 2 Signal Description

2.1 Device Pinout
Signals shown in **Bold** are not available on the 52 or 48 Pin Package
Signals shown in ***Bold Italic*** are available in the 52, but not the 48 Pin Package

PT[4:0]	IOC[4:0]	PW[4:0]	VDDX	PERT/ PPST	Disabled	Port T I/O Pins shared with timer and PWM

2.2.1 Pin Initialization for 48 & 52 Pin LQFP bond-out versions

Not Bonded Pins If the port pins are not bonded out in the chosen package the user should initialize the registers to be inputs with enabled pull resistance to avoid excess current consumption. This applies to the following pins:

(48LQFP): Port A[7:1], Port B[7:5], Port B[3:0], PortE[6,5,3,2], Port P[7:6], PortP[4:0], Port J[7:6], PortS[3:2]

(52LQFP): Port A[7:3], Port B[7:5], Port B[3:0], PortE[6,5,3,2], Port P[7:6], PortP[2:0], Port J[7:6], PortS[3:2]

2.3 Detailed Signal Descriptions

2.3.1 EXTAL, XTAL — Oscillator Pins

EXTAL and XTAL are the crystal driver and external clock pins. On reset all the device clocks are derived from the EXTAL input frequency. XTAL is the crystal output.

2.3.2 $\overline{\text{RESET}}$ — External Reset Pin

RESET is an active low bidirectional control signal that acts as an input to initialize the MCU to a known start-up state. It also acts as an open-drain output to indicate that an internal failure has been detected in either the clock monitor or COP watchdog circuit. External circuitry connected to the RESET pin should not include a large capacitance that would interfere with the ability of this signal to rise to a valid logic one within 32 ECLK cycles after the low drive is released. Upon detection of any reset, an internal circuit drives the RESET pin low and a clocked reset sequence controls when the MCU can begin normal processing.

2.3.3 TEST / VPP — Test Pin

This pin is reserved for test and must be tied to VSS in all applications.

2.3.4 XFC — PLL Loop Filter Pin

Dedicated pin used to create the PLL loop filter. See CRG BUG for more detailed information.PLL loop filter. Please ask your Motorola representative for the interactive application note to compute PLL loop filter elements. Any current leakage on this pin must be avoided.
Figure 2-4 PLL Loop Filter Connections

2.3.5 BKGD / $\overline{\text{TAGHI}}$ / MODC — Background Debug, Tag High & Mode Pin

The BKGD / $\overline{\text{TAGHI}}$ / MODC pin is used as a pseudo-open-drain pin for the background debug communication. In MCU expanded modes of operation when instruction tagging is on, an input low on this pin during the falling edge of E-clock tags the high half of the instruction word being read into the instruction queue. It is also used as a MCU operating mode select pin at the rising edge during reset, when the state of this pin is latched to the MODC bit.

2.3.6 PA[7:0] / ADDR[15:8] / DATA[15:8] — Port A I/O Pins

PA7-PA0 are general purpose input or output pins. In MCU expanded modes of operation, these pins are used for the multiplexed external address and data bus. PA[7:1] pins are not available in the 48 package version. PA[7:3] are not available in the 52 pin package version.

2.3.7 PB[7:0] / ADDR[7:0] / DATA[7:0] — Port B I/O Pins

PB7-PB0 are general purpose input or output pins. In MCU expanded modes of operation, these pins are used for the multiplexed external address and data bus. PB[7:5] and PB[3:0] pins are not available in the 48 nor 52 pin package version.

2.3.8 PE7 / NOACC / $\overline{\text{XCLKS}}$ — Port E I/O Pin 7

PE7 is a general purpose input or output pin. During MCU expanded modes of operation, the NOACC signal, when enabled, is used to indicate that the current bus cycle is an unused or "free" cycle. This signal will assert when the CPU is not using the bus.The XCLKS is an input signal which controls whether a crystal in combination with the internal Colpitts (low power) oscillator is used or whether Pierce oscillator/external clock circuitry is used. The state of thispin is latched at the rising edge of RESET. If the input is a logic low the EXTAL pin is configured for an external clock drive or a Pierce Oscillator. If input is a logic high a Colpitts oscillator circuit is configured on EXTAL and XTAL. Since this pin is an input with a pull-up device during reset, if the pin is left floating, the default configuration is a Colpitts oscillator circuit on EXTAL and XTAL.
* Due to the nature of a translated ground Colpitts oscillator a
DC voltage bias is applied to the crystal
.Please contact the crystal manufacturer for crystal DC

Figure 2-5 Colpitts Oscillator Connections (PE7=1)

Figure 2-6 Pierce Oscillator Connections (PE7=0)
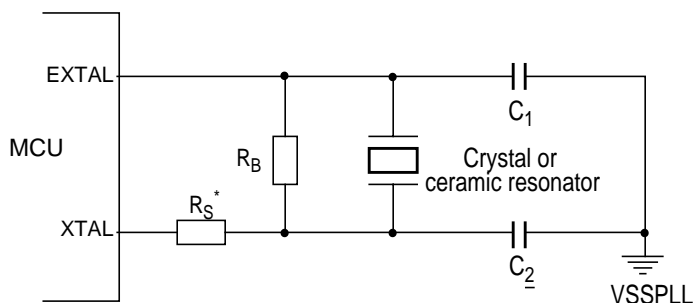

* Rs can be zero (shorted) when use with higher frequency crystals.
 Refer to manufacturer's data.

Figure 2-7 External Clock Connections (PE7=0)

2.3.9 PE6 / MODB / IPIPE1 — Port E I/O Pin 6

PE6 is a general purpose input or output pin. It is used as a MCU operating mode select pin during reset. The state of this pin is latched to the MODB bit at the rising edge of RESET. This pin is shared with the instruction queue tracking signal IPIPE1. This pin is an input with a pull-down device which is only active when RESET is low. PE[6] is not available in the 48 / 52 pin package versions.

2.3.10 PE5 / MODA / IPIPE0 — Port E I/O Pin 5

PE5 is a general purpose input or output pin. It is used as a MCU operating mode select pin during reset. The state of this pin is latched to the MODA bit at the rising edge of RESET. This pin is shared with the instruction queue tracking signal IPIPE0. This pin is an input with a pull-down device which is only active when RESET is low. This pin is not available in the 48 / 52 pin package versions.

2.3.11 PE4 / ECLK— Port E I/O Pin [4] / E-Clock Output

ECLK is the output connection for the internal bus clock. It is used to demultiplex the address and data in expanded modes and is used as a timing reference. ECLK frequency is equal to 1/2 the crystal frequency out of reset. The ECLK pin is initially configured as ECLK output with stretch in all expanded modes. The E clock output function depends upon the settings of the NECLK bit in the PEAR register, the IVIS bit in the MODE register and the ESTR bit in the EBICTL register. All clocks, including the E clock, are halted when the MCU is in STOP mode. It is possible to configure the MCU to interface to slow external memory. ECLK can be stretched for such accesses. Reference the MISC register (EXSTR[1:0] bits) for more information. In normal expanded narrow mode, the E clock is available for use in external select decode logic or as a constant speed clock for use in the external application system.

2.3.12 PE3 / $\overline{\text{LSTRB}}$ — Port E I/O Pin [3] / Low-Byte Strobe ($\overline{\text{LSTRB}}$)

In all modes this pin can be used as a general-purpose I/O and is an input with an active pull-up out of reset. If the strobe function is required, it should be enabled by setting the LSTRE bit in the PEAR register. This signal is used in write operations. Therefore external low byte writes will not be possible until this function is enabled. This pin is also used as $\overline{\text{TAGLO}}$ in Special Expanded modes and is multiplexed with the $\overline{\text{LSTRB}}$ function. This pin is not available in the 48 / 52 pin package versions.

2.3.13 PE2 / R/$\overline{\text{W}}$ — Port E I/O Pin [2] / Read/$\overline{\text{Write}}$

In all modes this pin can be used as a general-purpose I/O and is an input with an active pull-up out of reset. If the read/write function is required it should be enabled by setting the RDWE bit in the PEAR register. External writes will not be possible until enabled. This pin is not available in the 48 / 52 pin package versions.

2.3.14 PE1 / $\overline{\text{IRQ}}$ — Port E input Pin [1] / Maskable Interrupt Pin

The $\overline{\text{IRQ}}$ input provides a means of applying asynchronous interrupt requests to the MCU. Either falling edge-sensitive triggering or level-sensitive triggering is program selectable (INTCR register). $\overline{\text{IRQ}}$ is always enabled and configured to level-sensitive triggering out of reset. It can be disabled by clearing IRQEN bit (INTCR register). When the MCU is reset the $\overline{\text{IRQ}}$ function is masked in the condition code register. This pin is always an input and can always be read. There is an active pull-up on this pin while in reset and immediately out of reset. The pull-up can be turned off by clearing PUPEE in the PUCR register.

2.3.15 PE0 / $\overline{\text{XIRQ}}$ — Port E input Pin [0] / Non Maskable Interrupt Pin

The $\overline{\text{XIRQ}}$ input provides a means of requesting a non maskable interrupt after reset initialization. During reset, the X bit in the condition code register (CCR) is set and any interrupt is masked until MCU software enables it. Because the $\overline{\text{XIRQ}}$ input is level sensitive, it can be connected to a multiple-source wired-OR network. This pin is always an input and can always be read. There is an active pull-up on this pin while in reset and immediately out of reset. The pull-up can be turned off by clearing PUPEE in the PUCR register.

2.3.16 PAD[7:0] / AN[7:0] — Port AD I/O Pins [7:0]

PAD7-PAD0 are general purpose I/O pins and also analog inputs for the analog to digital converter.

2.3.17 PP[7] / KWP[7] — Port P I/O Pin [7]

PP7 is a general purpose input or output pin, shared with the keypad interrupt function. When configured as an input, it can generate interrupts causing the MCU to exit STOP or WAIT mode. This pin is not available in the 48 / 52 pin package versions.

2.3.18 PP[6] / KWP[6]/ROMCTL — Port P I/O Pin [6]

PP6 is a general purpose input or output pin, shared with the keypad interrupt function. When configured as an input, it can generate interrupts causing the MCU to exit STOP or WAIT mode. This pin is not available in the 48 / 52 pin package versions. During MCU expanded modes of operation, this pin is used to enable the Flash EEPROM memory in the memory map (ROMCTL). At the rising edge of RESET, the state of this pin is latched to the ROMON bit.
PP6=1 in emulation modes equates to ROMON =0   (ROM space externally mapped)
PP6=0 in expanded modes equates to ROMON =0   (ROM space externally mapped)

2.3.19 PP[5:0] / KWP[5:0] / PW[5:0] — Port P I/O Pins [5:0]

PP[5:0] are general purpose input or output pins, shared with the keypad interrupt function. When configured as inputs, they can generate interrupts causing the MCU to exit STOP or WAIT mode. PP[5:0] are also shared with the PWM output signals, PW[5:0]. Pins PP[2:0] are only available in the 80 pin package version. Pins PP[4:3] are only available in the 52 and 80 pin package version.

2.3.20 PJ[7:6] / KWJ[7:6] — Port J I/O Pins [7:6]

PJ[7:6] are general purpose input or output pins, shared with the keypad interrupt function. When configured as inputs, they can generate interrupts causing the MCU to exit STOP or WAIT mode. These pins are not available in the 48 pin package version nor in the 52 pin package version.

2.3.21 PM5 / SCK — Port M I/O Pin 5

PM5 is a general purpose input or output pin and also the serial clock pin SCK for the Serial Peripheral Interface (SPI).

2.3.22 PM4 / MOSI — Port M I/O Pin 4

PM4 is a general purpose input or output pin and also the master output (during master mode) or slave input (during slave mode) pin for the Serial Peripheral Interface (SPI).

2.3.23 PM3 / $\overline{SS}$ — Port M I/O Pin 3

PM3 is a general purpose input or output pin and also the slave select pin $\overline{SS}$ for the Serial Peripheral Interface (SPI).

2.3.24 PM2 / MISO — Port M I/O Pin 2

PM2 is a general purpose input or output pin and also the master input (during master mode) or slave output (during slave mode) pin for the Serial Peripheral Interface (SPI).

2.3.25 PM1 / TXCAN — Port M I/O Pin 1

PM1 is a general purpose input or output pin and the transmit pin TXCAN of the CAN module.

2.3.26 PM0 / RXCAN — Port M I/O Pin 0

PM0 is a general purpose input or output pin and the receive pin RXCAN of the CAN module.

2.3.27 PS[3:2] — Port S I/O Pins [3:2]

PS3 and PS2 are general purpose input or output pins. These pins are not available in the 48 / 52 pin package versions.

2.3.28 PS1 / TXD — Port S I/O Pin 1

PS1 is a general purpose input or output pin and the transmit pin TXD of Serial Communication Interface (SCI).

2.3.29 PS0 / RXD — Port S I/O Pin 0

PS0 is a general purpose input or output pin and the receive pin RXD of Serial Communication Interface (SCI).

2.3.30 PPT[7:5] / IOC[7:5] — Port T I/O Pins [7:5]

PT7-PT5 are general purpose input or output pins. They can also be configured as the timer system input capture or output compare pins IOC7-IOC5.

2.3.31 PT[4:0] / IOC[4:0] / PW[4:0]— Port T I/O Pins [4:0]

PT4-PT0 are general purpose input or output pins. They can also be configured as the timer system input capture or output compare pins IOC4-IOC0 or as the PWM outputs PW[4:0]/

2.4 Power Supply Pins

2.4.1 VDDX,VSSX — Power & Ground Pins for I/O Drivers

External power and ground for I/O drivers. Bypass requirements depend on how heavily the MCU pins are loaded.

2.4.2 VDDR, VSSR — Power & Ground Pins for I/O Drivers & for Internal Voltage Regulator

External power and ground for I/O drivers and input to the internal voltage regulator. Bypass requirements depend on how heavily the MCU pins are loaded.

2.4.3 VDD1, VDD2, VSS1, VSS2 — Core Power Pins

Power is supplied to the MCU through VDD and VSS. This 2.5V supply is derived from the internal voltage regulator. There is no static load on those pins allowed. The internal voltage regulator is turned off, if VDDR is tied to ground.

2.4.4 VDDA, VSSA — Power Supply Pins for ATD and VREG

VDDA, VSSA are the power supply and ground input pins for the voltage regulator and the analog to digital converter. .

2.4.5 VRH, VRL — ATD Reference Voltage Input Pins

VRH and VRL are the reference voltage input pins for the analog to digital converter.

2.4.6 VDDPLL, VSSPLL — Power Supply Pins for PLL

Provides operating voltage and ground for the Oscillator and the Phased-Locked Loop. This allows the supply voltage to the Oscillator and PLL to be bypassed independently.This 2.5V voltage is generated by the internal voltage regulator.

Table 2-2 MC9S12C32 Power and Ground Connection Summary

Mnemonic	Nominal Voltage	Description
VDD1 **VDD2**	2.5 V	Internal power and ground generated by internal regulator. These also allow an external source to supply the core VDD/VSS voltages and bypass the internal voltage regulator. In the 48 and 52 LQFP packages VDD2 and VSS2 are not available.
VSS1 **VSS2**	0V	
VDDR	5.0 V	External power and ground, supply to internal voltage regulator.
VSSR	0 V	
VDDX	5.0 V	External power and ground, supply to pin drivers.
VSSX	0 V	
VDDA	5.0 V	Operating voltage and ground for the analog-to-digital converters and the reference for the internal voltage regulator, allows the supply voltage to the A/D to be bypassed independently.
VSSA	0 V	
VRH	5.0 V	Reference voltage low for the ATD converter. In the 48 and 52 LQFP packages VRL is bonded to VSSA.
VRL	0 V	
VDDPLL	2.5 V	Provides operating voltage and ground for the Phased-Locked Loop. This allows the supply voltage to the PLL to be bypassed independently. Internal power and ground generated by internal regulator.
VSSPLL	0 V	

NOTE: *All VSS pins must be connected together in the application. Because fast signal transitions place high, short-duration current demands on the power supply, use bypass capacitors with high-frequency characteristics and place them as close to the MCU as possible. Bypass requirements depend on MCU pin load.*

Section 3 System Clock Description

The Clock and Reset Generator provides the internal clock signals for the core and all peripheral modules. **Figure 3-1** shows the clock connections from the CRG to all modules. Consult the CRG Block User Guide for details on clock generation.
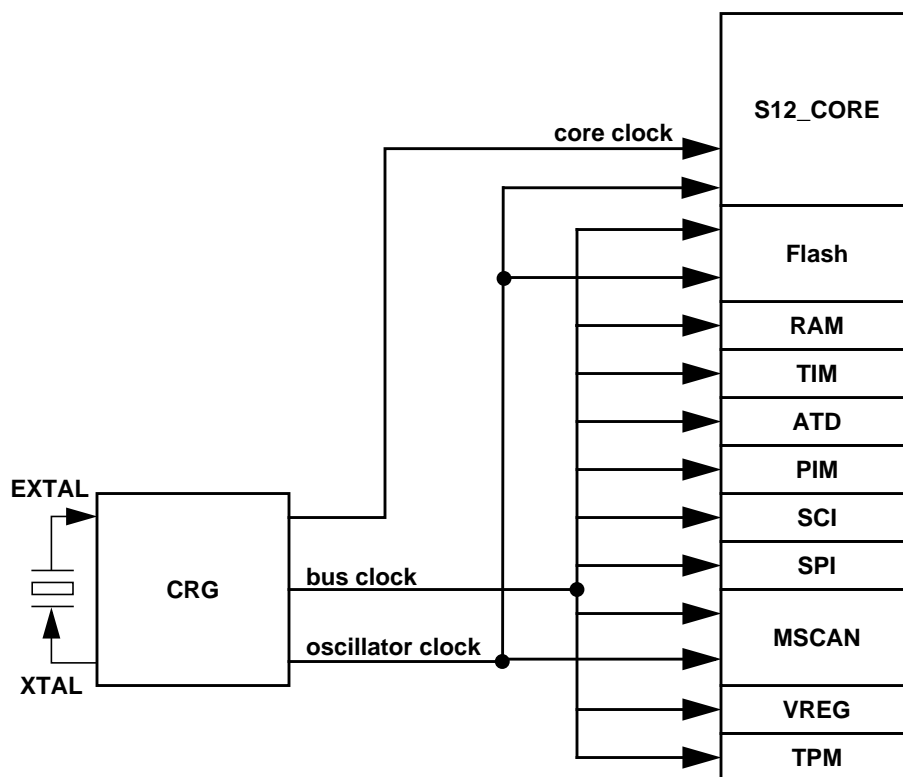

Figure 3-1 Clock Connections

Section 4 Modes of Operation

4.1 Overview

Eight possible modes determine the operating configuration of the MC9S12C32. Each mode has an associated default memory map and external bus configuration controlled by a further pin.

Three low power modes exist for the device.

4.2 Chip Configuration Summary

The operating mode out of reset is determined by the states of the MODC, MODB, and MODA pins during reset. The MODC, MODB, and MODA bits in the MODE register show the current operating mode and provide limited mode switching during operation. The states of the MODC, MODB, and MODA pins are latched into these bits on the rising edge of the reset signal. The ROMCTL signal allows the setting of the ROMON bit in the MISC register thus controlling whether the internal Flash is visible in the memory map. ROMON = 1 mean the Flash is visible in the memory map. The state of the ROMCTL pin is latched into the ROMON bit in the MISC register on the rising edge of the reset signal.

Table 4-1 Mode Selection

BKGD = MODC	PE6 = MODB	PE5 = MODA	PP6 = ROMCTL	ROMON Bit	Mode Description
0	0	0	X	1	Special Single Chip, BDM allowed and ACTIVE. BDM is allowed in all other modes but a serial command is required to make BDM active.
0	0	1	0	1	Emulation Expanded Narrow, BDM allowed
			1	0	
0	1	0	X	0	Special Test (Expanded Wide), BDM allowed
0	1	1	0	1	Emulation Expanded Wide, BDM allowed
			1	0	
1	0	0	X	1	Normal Single Chip, BDM allowed
1	0	1	0	0	Normal Expanded Narrow, BDM allowed
			1	1	
1	1	0	X	1	Peripheral; BDM allowed but bus operations would cause bus conflicts (must not be used)
1	1	1	0	0	Normal Expanded Wide, BDM allowed
			1	1	

For further explanation on the modes refer to the Core User Guide.

Table 4-2 Clock Selection Based on PE7

PE7 = $\overline{\text{XCLKS}}$	Description
1	Colpitts Oscillator selected
0	Pierce Oscillator/external clock selected

4.3 Security

The device will make available a security feature preventing the unauthorized read and write of the memory contents. This feature allows:

- Protection of the contents of FLASH,
- Operation in single-chip mode,
- Operation from external memory with internal FLASH disabled.

The user must be reminded that part of the security must lie with the user's code. An extreme example would be user's code that dumps the contents of the internal program. This code would defeat the purpose of security. At the same time the user may also wish to put a back door in the user's program. An example of this is the user downloads a key through the SCI which allows access to a programming routine that updates parameters.

4.3.1 Securing the Microcontroller

Once the user has programmed the FLASH, the part can be secured by programming the security bits located in the FLASH module. These non-volatile bits will keep the part secured through resetting the part and through powering down the part.

The security byte resides in a portion of the Flash array.

Check the Flash Block User Guide for more details on the security configuration.

4.3.2 Operation of the Secured Microcontroller

4.3.2.1 Normal Single Chip Mode

This will be the most common usage of the secured part. Everything will appear the same as if the part was not secured with the exception of BDM operation. The BDM operation will be blocked.

4.3.2.2 Executing from External Memory

The user may wish to execute from external space with a secured microcontroller. This is accomplished by resetting directly into expanded mode. The internal FLASH will be disabled. BDM operations will be blocked.

4.3.3 Unsecuring the Microcontroller

In order to unsecure the microcontroller, the internal FLASH must be erased. This can be done through an external program in expanded mode or via a sequence of BDM commands. Unsecuring is also possible via the Backdoor Key Access. Refer to Flash Block Guide for details.

Once the user has erased the FLASH, the part can be reset into special single chip mode. This invokes a program that verifies the erasure of the internal FLASH. Once this program completes, the user can erase and program the FLASH security bits to the unsecured state. This is generally done through the BDM, but the user could also change to expanded mode (by writing the mode bits through the BDM) and jumping to an external program (again through BDM commands). Note that if the part goes through a reset before the security bits are reprogrammed to the unsecure state, the part will be secured again.

4.4 Low Power Modes

The microcontroller features three main low power modes. Consult the respective Block User Guide for information on the module behavior in Stop, Pseudo Stop, and Wait Mode. An important source of information about the clock system is the Clock and Reset Generator User Guide (CRG).

4.4.1 Stop

Executing the CPU STOP instruction stops all clocks and the oscillator thus putting the chip in fully static mode. Wake up from this mode can be done via reset or external interrupts.

4.4.2 Pseudo Stop

This mode is entered by executing the CPU STOP instruction. In this mode the oscillator is still running and the Real Time Interrupt (RTI) or Watchdog (COP) sub module can stay active. Other peripherals are turned off. This mode consumes more current than the full STOP mode, but the wake up time from this mode is significantly shorter.

4.4.3 Wait

This mode is entered by executing the CPU WAI instruction. In this mode the CPU will not execute instructions. The internal CPU signals (address and databus) will be fully static. All peripherals stay active. For further power consumption the peripherals can individually turn off their local clocks.

4.4.4 Run

Although this is not a low power mode, unused peripheral modules should not be enabled in order to save power.

Section 5 Resets and Interrupts

5.1 Overview

Consult the Exception Processing section of the HCS12 Core User Guide for information on resets and interrupts.

5.2 Vectors

5.2.1 Vector Table

Table 5-1 lists interrupt sources and vectors in default order of priority.

Table 5-1 Interrupt Vector Locations

Vector Address	Interrupt Source	CCR Mask	Local Enable	HPRIO Value to Elevate
$FFFE, $FFFF	External Reset, Power On Reset or Low Voltage Reset (see CRG Flags Register to determine reset source)	None	None	–
$FFFC, $FFFD	Clock Monitor fail reset	None	COPCTL (CME, FCME)	–
$FFFA, $FFFB	COP failure reset	None	COP rate select	–
$FFF8, $FFF9	Unimplemented instruction trap	None	None	–
$FFF6, $FFF7	SWI	None	None	–
$FFF4, $FFF5	XIRQ	X-Bit	None	–
$FFF2, $FFF3	IRQ	I-Bit	INTCR (IRQEN)	$F2
$FFF0, $FFF1	Real Time Interrupt	I-Bit	CRGINT (RTIE)	$F0

$FFEE, $FFEF	Standard Timer channel 0	I-Bit	TIE (C0I)	$EE
$FFEC, $FFED	Standard Timer channel 1	I-Bit	TIE (C1I)	$EC
$FFEA, $FFEB	Standard Timer channel 2	I-Bit	TIE (C2I)	$EA
$FFE8, $FFE9	Standard Timer channel 3	I-Bit	TIE (C3I)	$E8
$FFE6, $FFE7	Standard Timer channel 4	I-Bit	TIE (C4I)	$E6
$FFE4, $FFE5	Standard Timer channel 5	I-Bit	TIE (C5I)	$E4
$FFE2, $FFE3	Standard Timer channel 6	I-Bit	TIE (C6I)	$E2
$FFE0, $FFE1	Standard Timer channel 7	I-Bit	TIE (C7I)	$E0
$FFDE, $FFDF	Standard Timer overflow	I-Bit	TMSK2 (TOI)	$DE
$FFDC, $FFDD	Pulse accumulator A overflow	I-Bit	PACTL (PAOVI)	$DC
$FFDA, $FFDB	Pulse accumulator input edge	I-Bit	PACTL (PAI)	$DA
$FFD8, $FFD9	SPI	I-Bit	SPICR1 (SPIE, SPTIE)	$D8
$FFD6, $FFD7	SCI	I-Bit	SCICR2 (TIE, TCIE, RIE, ILIE)	$D6
$FFD4, $FFD5	Reserved			
$FFD2, $FFD3	ATD	I-Bit	ATDCTL2 (ASCIE)	$D2
$FFD0, $FFD1	Reserved			
$FFCE, $FFCF	Port J	I-Bit	PIEP (PIEP7-6)	$CE
$FFCC, $FFCD	Reserved			
$FFCA, $FFCB	Reserved			
$FFC8, $FFC9	Reserved			
$FFC6, $FFC7	CRG PLL lock	I-Bit	PLLCR (LOCKIE)	$C6
$FFC4, $FFC5	CRG Self Clock Mode	I-Bit	PLLCR (SCMIE)	$C4
$FFBA to $FFC3	Reserved			
$FFB8, $FFB9	FLASH	I-Bit	FCNFG (CCIE, CBEIE)	$B8
$FFB6, $FFB7	CAN wake-up	I-Bit	CANRIER (WUPIE)	$B6
$FFB4, $FFB5	CAN errors	I-Bit	CANRIER (CSCIE, OVRIE)	$B4
$FFB2, $FFB3	CAN receive	I-Bit	CANRIER (RXFIE)	$B2
$FFB0, $FFB1	CAN transmit	I-Bit	CANTIER (TXEIE[2:0])	$B0
$FF90 to $FFAF	Reserved			
$FF8E, $FF8F	Port P	I-Bit	PIEP (PIEP7-0)	$8E
$FF8C, $FF8D	PWM Emergency Shutdown	I-Bit	PWMSDN(PWMIE)	$8C
$FF8A, $FF8B	VREG LVI	I-Bit	CTRL0 (LVIE)	$8A
$FF80 to $FF89	Reserved			

5.3 Resets

Resets are a subset of the interrupts featured in **Table 5-1**. The different sources capable of generating a system reset are summarized in **Table 5-2**. When a reset occurs, MCU registers and control bits are changed to known start-up states. Refer to the respective module Block User Guides for register reset states

5.3.1 Reset Summary Table

Table 5-2 Reset Summary

Reset	Priority	Source	Vector
Power-on Reset	1	CRG Module	$FFFE, $FFFF
External Reset	1	RESET pin	$FFFE, $FFFF
Low Voltage Reset	1	VREG Module	$FFFE, $FFFF
Clock Monitor Reset	2	CRG Module	$FFFC, $FFFD
COP Watchdog Reset	3	CRG Module	$FFFA, $FFFB

5.3.2 Effects of Reset

When a reset occurs, MCU registers and control bits are changed to known start-up states. Refer to the respective module Block User Guides for register reset states. Refer to the HCS12 Core User Guides for mode dependent pin configuration of port A, B and E out of reset.

Refer to the PIM Block User Guide for reset configurations of all peripheral module ports.

Refer to for locations of the memories depending on the operating mode after reset.

The RAM array is not automatically initialized out of reset.

Refer to **Table 1-1** for locations of the memories depending on the operating mode after reset.

> **NOTE:**   *For devices assembled in 48-pin or 52-pin LQFP packages all non-bonded out pins should be configured as outputs after reset in order to avoid current drawn from floating inputs. Refer to* **Table 2-1** *for affected pins.*

Section 6 HCS12 Core Block Description

Consult the HCS12 Core User Guide for information about the HCS12 core modules, i.e. central processing unit (CPU), interrupt module (INT), module mapping control module (MMC), multiplexed external bus interface (MEBI), debug12 module (DBG12) and background debug mode module (BDM).

6.1 Device-specific information

6.1.1 PPAGE

External paging is not supported on this device. In order to access the 16K Flash Block1 in the address range $8000-$BFFF the PPAGE register must be loaded with a valid value for this range. Valid PPAGE values for Flash Block1 visibility in the $8000-$BFFF range are PPAGE=$00, $02...$38, $3A, $3C, $3E.

Flash Block1 is also visible in the $4000-$7FFF range if ROMHM is cleared.

Flash Block2 is visible in the $8000-$BFFF range with PPAGE=$01,$03,$05,$07....$39,$3B,$3D,$3F.

Flash Block2 is always visible in the range $C000-$FFFF if ROMON is set.

6.1.2 BDM alternate clock

The BDM section of S12 Core User Guide reference to **alternate clock** is equivalent to **oscillator clock**.

Section 7 Voltage Regulator (VREG) Block Description

Consult the VREG Block User Guide for information about the dual output linear voltage regulator.

7.1 Device-specific information

The VREG is part of the IPBus domain.

7.1.1 VREGEN

VREGEN is connected internally to VDDR.

7.1.2 VDD1, VDD2, VSS1, VSS2

In the 80 pin QFP package version, both internal VDD and VSS of the 2.5V domain are bonded out on 2 sides of the device as two pin pairs (VDD1, VSS1 & VDD2, VSS2). VDD1 and VDD2 are connected together internally. VSS1 and VSS2 are connected together internally.

The extra pin pair enables systems using the 80 pin package to employ better supply routing and further decoupling.

Section 8 Recommended Printed Circuit Board Layout

The PCB must be carefully laid out to ensure proper operation of the voltage regulator as well as of the MCU itself. The following rules must be observed:

- Every supply pair must be decoupled by a ceramic capacitor connected as near as possible to the corresponding pins (C1 - C6).

- Central point of the ground star should be the VSSR pin.

- Use low ohmic low inductance connections between VSS1, VSS2 and VSSR.

- VSSPLL must be directly connected to VSSR.

- Keep traces of VSSPLL, EXTAL and XTAL as short as possible and occupied board area for C7, C8, C11 and Q1 as small as possible.

Freescale Semiconductor, Inc.

- Do not place other signals or supplies underneath area occupied by C7, C8, C10 and Q1 and the connection area to the MCU.

- Central power input should be fed in at the VDDA/VSSA pins.

Freescale Semiconductor, Inc.

Table 8-1 Recommended External Component Values

Component	Purpose	Type	Value
C1	VDD1 filter cap	ceramic X7R	220nF, [1]470nF
C2	VDD2 filter cap (80 QFP only)	ceramic X7R	220nF
C3	VDDA filter cap	ceramic X7R	100nF
C4	VDDR filter cap	X7R/tantalum	>=100nF
C5	VDDPLL filter cap	ceramic X7R	100nF
C6	VDDX filter cap	X7R/tantalum	>=100nF
C7	OSC load cap	See PLL specification chapter	
C8	OSC load cap		
C9	PLL loop filter cap	See PLL specification chapter	
C10	PLL loop filter cap		
C11	DC cutoff cap	Colpitts mode only, if recommended by quartz manufacturer	
R1	PLL loop filter res	See PLL Specification chapter	
Q1	Quartz		

NOTES:

1. In 48LQFP and 52LQFP package versions, VDD2 is not available. Thus 470nF must be connected to VDD1.

Section 9 Clock Reset Generator (CRG) Block Description

Consult the CRG Block User Guide for information about the Clock and Reset Generator module.

9.1 Device-specific information

The CRG is part of the IPBus domain.

The Low Voltage Reset feature uses the low voltage reset signal from the VREG module as an input to the CRG module. When the regulator output voltage supply to the internal chip logic falls below a specified threshold the LVR signal from the VREG module causes the CRG module to generate a reset. Consult the VREG Block User Guide for voltage level specifications.

9.1.1 $\overline{\text{XCLKS}}$

The $\overline{\text{XCLKS}}$ input signal is active low (see **2.3.8 PE7 / NOACC / XCLKS — Port E I/O Pin 7**).

Section 10 Oscillator (OSC) Block Description

Consult the OSC Block User Guide for information about the Oscillator module.

Section 11 Timer (TIM) Block Description

Consult the TIM_16B8C Block User Guide for information about the Timer module.

The TIM is part of the IPBus domain.

Section 12 Analog to Digital Converter (ATD) Block Description

12.1 Device-specific information

The ATD is part of the IPBus domain.

12.1.1 VRL (voltage reference low)

In the 48 and 52 pin package versions, the VRL pad is bonded internally to the VSSA pin.

Consult the ATD_10B8C Block User Guide for further information about the A/D Converter module.

Section 13 Serial Communications Interface (SCI) Block Description

Consult the SCI Block User Guide for information about the Serial Communications Interface module.

The SCI is part of the IPBus domain.

Section 14 Serial Peripheral Interface (SPI) Block Description

Consult the SPI Block User Guide for information about the Serial Peripheral Interface module.

The SPI is part of the IPBus domain.

Section 15 Flash EEPROM 32K Block Description

Consult the FTS32K Block User Guide for information about the Flash module.

The Flash is part of the HCS12 Bus domain.

Section 16 RAM Block Description

This module supports single-cycle misaligned word accesses without wait states.

Consult the SRAM2K Block User Guide for information about the RAM Module

The RAM is part of the HCS12 Bus domain.

Section 17   Pulse Width Modulator (PWM) Block Description

Only channels [5:0] of the PWM are implemented on the MC9S12C32.

Consult the PWM_8B6C Block User Guide for information about the Pulse Width Modulator Module.

The PWM is part of the IPBus domain.

Section 18 MSCAN Block Description

Consult the MSCAN Block User Guide for information about the Motorola Scalable CAN Module.

The MSCAN is part of the IPBus domain.

Section 19 Port Integration Module (PIM) Block Description

Consult the PIM_9C32 Block User Guide for information about the Port Integration Module.

The PIM is part of the IPBus domain.

Freescale Semiconductor, Inc.

Appendix A Electrical Characteristics

A.1 General

> **NOTE:** *The electrical characteristics given in this section are preliminary and should be used as a guide only. Values cannot be guaranteed by Motorola and are subject to change without notice.*

> **NOTE:** *The part is specified and tested over the 5V and 3.3V ranges. For the intermediate range, generally the electrical specifications for the 3.3V range apply, but the part is not tested in production test in the intermediate range.*

This supplement contains the most accurate electrical information for the MC9S12C32 microcontroller available at the time of publication. The information should be considered **PRELIMINARY** and is subject to change.

This introduction is intended to give an overview on several common topics like power supply, current injection etc.

A.1.1 Parameter Classification

The electrical parameters shown in this supplement are guaranteed by various methods. To give the customer a better understanding the following classification is used and the parameters are tagged accordingly in the tables where appropriate.

> **NOTE:** *This classification will be added at a later release of the specification*

P: Those parameters are guaranteed during production testing on each individual device.

C: Those parameters are achieved by the design characterization by measuring a statistically relevant sample size across process variations. They are regularly verified by production monitors.

T: Those parameters are achieved by design characterization on a small sample size from typical devices. All values shown in the typical column are within this category.

D: Those parameters are derived mainly from simulations.

A.1.2 Power Supply

The MC9S12C32 utilizes several pins to supply power to the I/O ports, A/D converter, oscillator and PLL as well as the digital core.

The VDDA, VSSA pair supplies the A/D converter.
The VDDX, VSSX pair supplies the I/O pins
The VDDR, VSSR pair supplies the internal voltage regulator.
VDD1, VSS1, VDD2 and VSS2 are the supply pins for the digital logic.
VDDPLL, VSSPLL supply the oscillator and the PLL.

VSS1 and VSS2 are internally connected by metal.
VDD1 and VDD2 are internally connected by metal.
VDDA, VDDX, VDDR as well as VSSA, VSSX, VSSR are connected by anti-parallel diodes for ESD protection.

> **NOTE:** *In the following context VDD5 is used for either VDDA, VDDR and VDDX; VSS5 is used for either VSSA, VSSR and VSSX unless otherwise noted.*
> *IDD5 denotes the sum of the currents flowing into the VDDA, VDDX and VDDR pins.*
> *VDD is used for VDD1, VDD2 and VDDPLL, VSS is used for VSS1, VSS2 and VSSPLL.*
> *IDD is used for the sum of the currents flowing into VDD1 and VDD2.*

A.1.3 Pins

There are four groups of functional pins.

A.1.3.1 5V I/O pins

Those I/O pins have a nominal level of 5V. This class of pins is comprised of all port I/O pins, the analog inputs, BKGD pin and the RESET inputs.The internal structure of all those pins is identical, however some of the functionality may be disabled. E.g. pull-up and pull-down resistors may be disabled permanently.

A.1.3.2 Analog Reference

This class is made up by the two VRH and VRL pins. In 48 and 52 pin package versions the VRL pad is bonded to the VSSA pin.

A.1.3.3 Oscillator

The pins XFC, EXTAL, XTAL dedicated to the oscillator have a nominal 2.5V level. They are supplied by VDDPLL.

A.1.3.4 TEST

This pin is used for production testing only.

A.1.4 Current Injection

Power supply must maintain regulation within operating V_{DD5} or V_{DD} range during instantaneous and operating maximum current conditions. If positive injection current ($V_{in} > V_{DD5}$) is greater than I_{DD5}, the injection current may flow out of VDD5 and could result in external power supply going out of regulation. Insure external VDD5 load will shunt current greater than maximum injection current. This will be the greatest risk when the MCU is not consuming power; e.g. if no system clock is present, or if clock rate is very low which would reduce overall power consumption.

A.1.5 Absolute Maximum Ratings

Absolute maximum ratings are stress ratings only. A functional operation under or outside those maxima is not guaranteed. Stress beyond those limits may affect the reliability or cause permanent damage of the device.

This device contains circuitry protecting against damage due to high static voltage or electrical fields; however, it is advised that normal precautions be taken to avoid application of any voltages higher than maximum-rated voltages to this high-impedance circuit. Reliability of operation is enhanced if unused inputs are tied to an appropriate logic voltage level (e.g., either V_{SS5} or V_{DD5}).

Table A-1 Absolute Maximum Ratings

Num	Rating	Symbol	Min	Max	Unit
1	I/O, Regulator and Analog Supply Voltage	V_{DD5}	-0.3	6.5	V
2	Digital Logic Supply Voltage[1]	V_{DD}	-0.3	3.0	V
3	PLL Supply Voltage [1]	V_{DDPLL}	-0.3	3.0	V
4	Voltage difference VDDX to VDDR and VDDA	Δ_{VDDX}	-0.3	0.3	V
5	Voltage difference VSSX to VSSR and VSSA	Δ_{VSSX}	-0.3	0.3	V
6	Digital I/O Input Voltage	V_{IN}	-0.3	6.5	V
7	Analog Reference	V_{RH}, V_{RL}	-0.3	6.5	V
8	XFC, EXTAL, XTAL inputs	V_{ILV}	-0.3	3.0	V
9	TEST input	V_{TEST}	-0.3	10.0	V
10	Instantaneous Maximum Current Single pin limit for all digital I/O pins [2]	I_D	-25	+25	mA
11	Instantaneous Maximum Current Single pin limit for XFC, EXTAL, XTAL[3]	I_{DL}	-25	+25	mA
12	Instantaneous Maximum Current Single pin limit for TEST[4]	I_{DT}	-0.25	0	mA
13	Operating Temperature Range (packaged)	T_A	– 40	125	°C
14	Operating Temperature Range (junction)	T_J	– 40	140	°C
15	Storage Temperature Range	T_{stg}	– 65	155	°C

NOTES:
 1. The device contains an internal voltage regulator to generate the logic and PLL supply out of the I/O supply.
    The absolute maximum ratings apply when the device is powered from an external source.
 2. All digital I/O pins are internally clamped to V_{SSX} and V_{DDX}, V_{SSR} and V_{DDR} or V_{SSA} and V_{DDA}.
 3. These pins are internally clamped to V_{SSPLL} and V_{DDPLL}
 4. This pin is clamped low to V_{SSPLL}, but not clamped high. This pin must be tied low in applications.

A.1.6 ESD Protection and Latch-up Immunity

All ESD testing is in conformity with CDF-AEC-Q100 Stress test qualification for Automotive Grade Integrated Circuits. During the device qualification ESD stresses were performed for the Human Body Model (HBM), the Machine Model (MM) and the Charge Device Model.

A device will be defined as a failure if after exposure to ESD pulses the device no longer meets the device specification. Complete DC parametric and functional testing is performed per the applicable device specification at room temperature followed by hot temperature, unless specified otherwise in the device specification.

Table A-2 ESD and Latch-up Test Conditions

Model	Description	Symbol	Value	Unit
Human Body	Series Resistance	R1	1500	Ohm
	Storage Capacitance	C	100	pF
	Number of Pulse per pin positive negative	-	- 3 3	
Machine	Series Resistance	R1	0	Ohm
	Storage Capacitance	C	200	pF
	Number of Pulse per pin positive negative	-	- 3 3	
Latch-up	Minimum input voltage limit		-2.5	V
	Maximum input voltage limit		7.5	V

Table A-3 ESD and Latch-Up Protection Characteristics

Num	C	Rating	Symbol	Min	Max	Unit
1	C	Human Body Model (HBM)	V_{HBM}	2000	-	V
2	C	Machine Model (MM)	V_{MM}	200	-	V
3	C	Charge Device Model (CDM)	V_{CDM}	500	-	V
4	C	Latch-up Current at 125°C positive negative	I_{LAT}	+100 -100	-	mA
5	C	Latch-up Current at 27°C positive negative	I_{LAT}	+200 -200	-	mA

A.1.7 Operating Conditions

This chapter describes the operating conditions of the device. Unless otherwise noted those conditions apply to all the following data.

NOTE: *Instead of specifying ambient temperature all parameters are specified for the more meaningful silicon junction temperature. For power dissipation calculations refer to **Section A.1.8 Power Dissipation and Thermal Characteristics**.*

Table A-4 Operating Conditions

Rating	Symbol	Min	Typ	Max	Unit
I/O, Regulator and Analog Supply Voltage	V_{DD5}	2.97	5	5.5	V
Digital Logic Supply Voltage[1]	V_{DD}	2.25	2.5	2.75	V
PLL Supply Voltage [1]	V_{DDPLL}	2.25	2.5	2.75	V
Voltage Difference VDDX to VDDA	Δ_{VDDX}	-0.1	0	0.1	V
Voltage Difference VSSX to VSSR and VSSA	Δ_{VSSX}	-0.1	0	0.1	V
Oscillator	f_{osc}	0.5	-	16	MHz
Bus Frequency	f_{bus}	0.5	-	25	MHz
Operating Junction Temperature Range	T_J	-40	-	140	°C

NOTES:
1. The device contains an internal voltage regulator to generate the logic and PLL supply out of the I/O supply. .

A.1.8 Power Dissipation and Thermal Characteristics

Power dissipation and thermal characteristics are closely related. The user must assure that the maximum operating junction temperature is not exceeded. The average chip-junction temperature (T_J) in °C can be obtained from:

$$T_J = T_A + (P_D \bullet \Theta_{JA})$$

T_J = Junction Temperature, $[°C]$

T_A = Ambient Temperature, $[°C]$

P_D = Total Chip Power Dissipation, [W]

Θ_{JA} = Package Thermal Resistance, [°C/W]

The total power dissipation can be calculated from:

$$P_D = P_{INT} + P_{IO}$$

P_{INT} = Chip Internal Power Dissipation, [W]

Two cases with internal voltage regulator enabled and disabled must be considered:

1. Internal Voltage Regulator disabled

$$P_{INT} = I_{DD} \cdot V_{DD} + I_{DDPLL} \cdot V_{DDPLL} + I_{DDA} \cdot V_{DDA}$$

$$P_{IO} = \sum_i R_{DSON} \cdot I_{IO_i}^2$$

Which is the sum of all output currents on I/O ports associated with VDDX and VDDM.

For R_{DSON} is valid:

$$R_{DSON} = \frac{V_{OL}}{I_{OL}} ; \text{for outputs driven low}$$

respectively

$$R_{DSON} = \frac{V_{DD5} - V_{OH}}{I_{OH}} ; \text{for outputs driven high}$$

2. Internal voltage regulator enabled

$$P_{INT} = I_{DDR} \cdot V_{DDR} + I_{DDA} \cdot V_{DDA}$$

I_{DDR} is the current shown in **Table A-8** and not the overall current flowing into VDDR, which additionally contains the current flowing into the external loads with output high.

$$P_{IO} = \sum_i R_{DSON} \cdot I_{IO_i}^2$$

Which is the sum of all output currents on I/O ports associated with VDDX and VDDR.

Table A-5 Thermal Package Characteristics[1]

Num	C	Rating	Symbol	Min	Typ	Max	Unit
1	T	Thermal Resistance LQFP48, single layer PCB[2]	θ_{JA}	-	-	69	°C/W
2	T	Thermal Resistance LQFP48, double sided PCB with 2 internal planes[3]	θ_{JA}	-	-	53	°C/W
3	T	Junction to Board LQFP48	θ_{JB}			30	°C/W
4	T	Junction to Case LQFP48	θ_{JC}			20	°C/W
5	T	Junction to Package Top LQFP48	Ψ_{JT}			4	°C/W
6	T	Thermal Resistance LQFP52, single sided PCB	θ_{JA}	-	-	65	°C/W
7	T	Thermal Resistance LQFP52, double sided PCB with 2 internal planes	θ_{JA}	-	-	49	°C/W
8	T	Junction to Board LQFP52	θ_{JB}			31	°C/W
9	T	Junction to Case LQFP52	θ_{JC}			17	°C/W
10	T	Junction to Package Top LQFP52	Ψ_{JT}			3	°C/W
11	T	Thermal Resistance QFP 80, single sided PCB	θ_{JA}	-	-	52	°C/W
12	T	Thermal Resistance QFP 80, double sided PCB with 2 internal planes	θ_{JA}	-	-	42	°C/W
13	T	Junction to Board QFP80	θ_{JB}			28	°C/W
14	T	Junction to Case QFP80	θ_{JC}			18	°C/W
15	T	Junction to Package Top QFP80	Ψ_{JT}			4	°C/W

NOTES:
1. The values for thermal resistance are achieved by package simulations
2. PC Board according to EIA/JEDEC Standard 51-2
3. PC Board according to EIA/JEDEC Standard 51-7

A.1.9 I/O Characteristics

This section describes the characteristics of all I/O pins. All parameters are not always applicable, e.g. not all pins feature pull up/down resistances.

Freescale Semiconductor, Inc.

Table A-6 5V I/O Characteristics

Conditions are 4.5< VDDX <5.5V Termperature from -40˚C to +140˚C, unless otherwise noted							
Num	**C**	**Rating**	**Symbol**	**Min**	**Typ**	**Max**	**Unit**
1	P	Input High Voltage	V_{IH}	$0.65*V_{DD5}$	-	-	V
	T	Input High Voltage	V_{IH}	-	-	VDD5 + 0.3	V
2	P	Input Low Voltage	V_{IL}	-	-	$0.35*V_{DD5}$	V
	T	Input Low Voltage	V_{IL}	VSS5 - 0.3	-	-	V
3	C	Input Hysteresis	V_{HYS}		250		mV
4	P	Input Leakage Current (pins in high ohmic input mode)[1] $V_{in} = V_{DD5}$ or V_{SS5}	I_{in}	−2.5	-	2.5	µA
5	C	Output High Voltage (pins in output mode) Partial Drive $I_{OH} = -2mA$	V_{OH}	$V_{DD5} - 0.8$	-	-	V
6	P	Output High Voltage (pins in output mode) Full Drive IOH = −10mA	V_{OH}	$V_{DD5} - 0.8$	-	-	V
7	C	Output Low Voltage (pins in output mode) Partial Drive IOL = +2mA	V_{OL}	-	-	0.8	V
8	P	Output Low Voltage (pins in output mode) Full Drive I_{OL} = +10mA	V_{OL}	-	-	0.8	V
9	P	Internal Pull Up Device Current, tested at V_{IL} Max.	I_{PUL}	-	-	-130	µA
10	C	Internal Pull Up Device Current, tested at V_{IH} Min.	I_{PUH}	-10	-	-	µA
11	P	Internal Pull Down Device Current, tested at V_{IH} Min.	I_{PDH}	-	-	130	µA
12	C	Internal Pull Down Device Current, tested at V_{IL} Max.	I_{PDL}	10	-	-	µA
13	D	Input Capacitance	C_{in}		7	-	pF
14	T	Injection current[2] Single Pin limit Total Device Limit. Sum of all injected currents	I_{ICS} I_{ICP}	-2.5 -25	-	2.5 25	mA
15	P	Port P, J Interrupt Input Pulse filtered[3]	t_{PIGN}			3	µs
16	P	Port P, J Interrupt Input Pulse passed[3]	t_{PVAL}	10			µs

NOTES:
1. Maximum leakage current occurs at maximum operating temperature. Current decreases by approximately one-half for each 8 C to 12 C in the temperature range from 50 C to 125 C.
2. Refer to **Section A.1.4 Current Injection**, for more details
3. Parameter only applies in STOP or Pseudo STOP mode.

Table A-7 3.3V I/O Characteristics

		Conditions are VDDX=3.3V +/-10%, Termperature from -40˚C to +140˚C, unless otherwise noted					
Num	C	Rating	Symbol	Min	Typ	Max	Unit
1	P	Input High Voltage	V_{IH}	$0.65*V_{DD5}$	-	-	V
	T	Input High Voltage	V_{IH}	-	-	VDD5 + 0.3	V

9	P	Internal Pull Up Device Current, tested at V_{IL} Max.	I_{PUL}	-	-	−60	µA
10	C	Internal Pull Up Device Current, tested at V_{IH} Min.	I_{PUH}	-6	-	-	µA
11	P	Internal Pull Down Device Current, tested at V_{IH} Min.	I_{PDH}	-	-	60	µA
12	C	Internal Pull Down Device Current, tested at V_{IL} Max.	I_{PDL}	6	-	-	µA
11	D	Input Capacitance	C_{in}		7	-	pF
12	T	Injection current[2] Single Pin limit Total Device Limit. Sum of all injected currents	I_{ICS} I_{ICP}	-2.5 -25	-	2.5 25	mA
13	P	Port P, J Interrupt Input Pulse filtered[3]	t_{PIGN}			3	µs
14	P	Port P, J Interrupt Input Pulse passed[3]	t_{PVAL}	10			µs

NOTES:
1. Maximum leakage current occurs at maximum operating temperature. Current decreases by approximately one-half for each 8 C to 12 C in the temperature range from 50 C to 125 C.
2. Refer to **Section A.1.4 Current Injection**, for more details
3. Parameter only applies in STOP or Pseudo STOP mode.

A.1.10 Supply Currents

This section describes the current consumption characteristics of the device as well as the conditions for the measurements.

A.1.10.1 Measurement Conditions

All measurements are without output loads. Unless otherwise noted the currents are measured in single chip mode, internal voltage regulator enabled and at 25MHz bus frequency using a 4MHz oscillator.

A.1.10.2 Additional Remarks

In expanded modes the currents flowing in the system are highly dependent on the load at the address, data and control signals as well as on the duty cycle of those signals. No generally applicable numbers can be given. A very good estimate is to take the single chip currents and add the currents due to the external loads.

Table A-8 Supply Current Characteristics

Num	C	Rating	Symbol	Min	Typ	Max	Unit
1	P	Run Supply Current Single Chip	I_{DD5}			40	mA
2	P P C	Wait Supply current All modules enabled VDDR<4.9V, only RTI enabled[2] VDDR>4.9V, only RTI enabled	I_{DDW}		 3.5 2.5	30 8	mA
3	C P C P C P C P	Pseudo Stop Current (RTI and COP disabled)[2,3] -40°C 27°C 85°C "C" Temp Option 100°C 105°C "V" Temp Option 120°C 125°C "M" Temp Option 140°C	I_{DDPS}[1]		340 360 500 550 590 720 780 1100	 450 1450 1900 4500	µA
4	C C C C C	Pseudo Stop Current (RTI and COP enabled)[2,3] -40°C 27°C 85°C 105°C 125°C	I_{DDPS}[1]		540 700 750 880 1300		µA
5	C P C P C P C P	Stop Current [3] -40°C 27°C 85°C "C" Temp Option 100°C 105°C "V" Temp Option 120°C 125°C "M" Temp Option 140°C	I_{DDS}[1]		10 20 100 140 170 300 350 520	 80 1000 1400 4000	µA

NOTES:
1. STOP current measured in production test at increased junction temperature, hence for Temp Option "C" the test is carried out at 100˚C although the Temperature specification is 85˚C. Similarly for "v" and "M" options the temperature used in test lies 15˚C above the temperature option specification.
2. PLL off
3. At those low power dissipation levels $T_J = T_A$ can be assumed

Freescale Semiconductor, Inc.

Appendix B Electrical Specifications

B.1 Voltage Regulator Operating Conditions

Table B-1   -Voltage Regulator Electrical Parameters

Num	C	Characteristic	Symbol	Min	Typical	Max	Unit
1	P	Input Voltages	$V_{VDDR,A}$	2.97	—	5.5	V
2	P	Regulator Current Reduced Power Mode Shutdown Mode	I_{REG}	— —	20 12	50 40	μA μA
3	P	Output Voltage Core Full Performance Mode Reduced Power Mode Shutdown Mode	V_{DD}	2.35 1.6 —	2.5 2.5 —[1]	2.75 2.75 —	V V V
4	P	Output Voltage PLL Full Performance Mode Reduced Power Mode[2] Reduced Power Mode[3] Shutdown Mode	V_{DDPLL}	2.35 2.0 1.6 —	2.5 2.5 2.5 —[4]	2.75 2.75 2.75 —	V V V

6	P	Low Voltage Reset[6] Assert Level	V_{LVRA}	2.25	—	—	V
7	C	Power-on Reset[7] Assert Level Deassert Level	V_{PORA} V_{PORD}	0.97 —	— —	— 2.05	V V

NOTES:
1. High Impedance Output
2. Current IDDPLL = 1mA (Colpitts Oscillator)
3. Current IDDPLL = 3mA (Pierce Oscillator)
4. High Impedance Output
5. Monitors V_{DDA}, active only in Full Performance Mode. Indicates I/O & ADC performance degradation due to low supply voltage.
6. Monitors V_{DD}, active only in Full Performance Mode. MCU is monitored by the POR in RPM (see **Figure B-1**)
7. Monitors V_{DD}. Active in all modes.

> **NOTE:**   *The electrical characteristics given in this section are preliminary and should be used as a guide only. Values in this section cannot be guaranteed by Motorola and are subject to change without notice.*

B.2 Chip Power-up and LVI/LVR graphical explanation

B.2.0.1 POR

The release level V_{PORR} and the assert level V_{PORA} are derived from the V_{DD} Supply. They are also valid if the device is powered externally. After releasing the POR reset the oscillator and the clock quality check are started. If after a time t_{CQOUT} no valid oscillation is detected, the MCU will start using the internal self clock. The fastest startup time possible is given by n_{uposc}.

B.2.0.2 LVR

The release level V_{LVRR} and the assert level V_{LVRA} are derived from the V_{DD} Supply. They are also valid if the device is powered externally. After releasing the LVR reset the oscillator and the clock quality check are started. If after a time t_{CQOUT} no valid oscillation is detected, the MCU will start using the internal self clock. The fastest startup time possible is given by n_{uposc}.

Voltage regulator sub modules LVI (low voltage interrupt), POR (power-on reset) and LVR (low voltage reset) handle chip power-up or drops of the supply voltage. Their function is described in **Figure B-1**.

Figure B-1 Voltage Regulator - Chip Power-up and Voltage Drops (not scaled)

Freescale Semiconductor, Inc.

B.3 Output Loads

B.3.1 Resistive Loads

The on-chip voltage regulator is intended to supply the internal logic and oscillator circuits allows no external DC loads.

B.3.2 Capacitive Loads

The capacitive loads are specified in **Table B-2**. Ceramic capacitors with X7R dielectricum are required.

Table B-2 Voltage Regulator - Capacitive Loads

Num	Characteristic	Symbol	Min	Typical	Max	Unit
1	VDD external capacitive load	C_{DDext}	440	440	12000	nF
2	VDDPLL external capacitive load	$C_{DDPLLext}$	90	220	5000	nF

Freescale Semiconductor, Inc.

B.4 ATD Characteristics

This section describes the characteristics of the analog to digital converter.

VRL is not available as a separate pin in the 48 and 52 pin versions. In this case the internal VRL pad is bonded to the VSSA pin.

The ATD is specified and tested for both the 3.3V and 5V range. For ranges between 3.3V and 5V the ATD accuracy is generally the same as in the 3.3V range but is not tested in this range in production test.

B.4.1 ATD Operating Characteristics In 5V Range

The **Table B-3** shows conditions under which the ATD operates.

The following constraints exist to obtain full-scale, full range results:
VSSA ≤ VRL ≤ VIN ≤ VRH ≤ VDDA. This constraint exists since the sample buffer amplifier can not drive beyond the power supply levels that it ties to. If the input level goes outside of this range it will effectively be clipped.

Table B-3 ATD Operating Characteristics

Conditions are shown in **Table A-4** unless otherwise noted. Supply Voltage 5V-10% <= V_{DDA} <=5V+10%							
Num	C	Rating	Symbol	Min	Typ	Max	Unit
1	D	Reference Potential Low High	VRL VRH	VSSA VDDA/2		VDDA/2 VDDA	V V
2	C	Differential Reference Voltage[1]	VRH-VRL	4.75	5.0	5.25	V
3	D	ATD Clock Frequency	f_{ATDCLK}	0.5		2.0	MHz
4	D	ATD 10-Bit Conversion Period Clock Cycles[2] Conv, Time at 2.0MHz ATD Clock f_{ATDCLK}	N_{CONV10} T_{CONV10}	14 7		28 14	Cycles µs
5	D	ATD 8-Bit Conversion Period Clock Cycles[2] Conv, Time at 2.0MHz ATD Clock f_{ATDCLK}	N_{CONV10} T_{CONV10}	12 6		26 13	Cycles µs
5	D	Recovery Time (V_{DDA}=5.0 Volts)	t_{REC}			20	µs
6	P	Reference Supply current	I_{REF}			0.375	mA

NOTES:
1. Full accuracy is not guaranteed when differential voltage is less than 4.75V
2. The minimum time assumes a final sample period of 2 ATD clocks cycles while the maximum time assumes a final sample period of 16 ATD clocks.

B.4.2 ATD Operating Characteristics In 3.3V Range

The **Table B-3** shows conditions under which the ATD operates.

The following constraints exist to obtain full-scale, full range results:
$V_{SSA} \leq V_{RL} \leq V_{IN} \leq V_{RH} \leq V_{DDA}$. This constraint exists since the sample buffer amplifier can not drive

beyond the power supply levels that it ties to. If the input level goes outside of this range it will effectively be clipped

Table B-4 ATD Operating Characteristics

Num	C	Rating	Symbol	Min	Typ	Max	Unit
Conditions are shown in **Table A-4** unless otherwise noted; Supply Voltage 3.3V-10% <= V_{DDA} <= 3.3V+10%
1	D	Reference Potential Low High	V_{RL} V_{RH}	V_{SSA} $V_{DDA}/2$		$V_{DDA}/2$ V_{DDA}	V V
2	C	Differential Reference Voltage	V_{RH}-V_{RL}	3.0	3.3	3.6	V
3	D	ATD Clock Frequency	f_{ATDCLK}	0.5		2.0	MHz
4	D	ATD 10-Bit Conversion Period Clock Cycles[1] Conv, Time at 2.0MHz ATD Clock f_{ATDCLK}	N_{CONV10} T_{CONV10}	14 7		28 14	Cycles μs
5	D	ATD 8-Bit Conversion Period Clock Cycles[1] Conv, Time at 2.0MHz ATD Clock f_{ATDCLK}	N_{CONV8} T_{CONV8}	12 6		26 13	Cycles μs
6	D	Recovery Time (V_{DDA}=3.3 Volts)	t_{REC}			20	μs
7	P	Reference Supply current	I_{REF}			0.250	mA

NOTES:

1. The minimum time assumes a final sample period of 2 ATD clocks cycles while the maximum time assumes a final sample period of 16 ATD clocks.

B.4.3 Factors influencing accuracy

Three factors - source resistance, source capacitance and current injection - have an influenceon the accuracy of the ATD.

B.4.3.1 Source Resistance:

Due to the input pin leakage current as specified in **Table A-6** in conjunction with the source resistance there will be a voltage drop from the signal source to the ATD input. The maximum source resistance R_S specifies results in an error of less than 1/2 LSB (2.5mV) at the maximum leakage current. If device or operating conditions are less than worst case or leakage-induced error is acceptable, larger values of source resistance is allowable.

B.4.3.2 Source capacitance

When sampling an additional internal capacitor is switched to the input. This can cause a voltage drop due to charge sharing with the external and the pin capacitance. For a maximum sampling error of the input voltage ≤ 1LSB, then the external filter capacitor, $C_f \geq 1024 * (C_{INS} - C_{INN})$.

B.4.3.3 Current injection

There are two cases to consider.

1. A current is injected into the channel being converted. The channel being stressed has conversion values of $3FF ($FF in 8-bit mode) for analog inputs greater than VRH and $000 for values less than VRL unless the current is higher than specified as disruptive conditions.

2. Current is injected into pins in the neighborhood of the channel being converted. A portion of this current is picked up by the channel (coupling ratio K), This additional current impacts the accuracy of the conversion depending on the source resistance.
   The additional input voltage error on the converted channel can be calculated as $V_{ERR} = K * R_S * I_{INJ}$, with I_{INJ} being the sum of the currents injected into the two pins adjacent to the converted channel.

Table B-5 ATD Electrical Characteristics

Conditions are shown in **Table A-4** unless otherwise noted							
Num	**C**	**Rating**	**Symbol**	**Min**	**Typ**	**Max**	**Unit**
1	C	Max input Source Resistance	R_S	-	-	1	KΩ
2	T	Total Input Capacitance Non Sampling Sampling	C_{INN} C_{INS}			10 15	pF
3	C	Disruptive Analog Input Current	I_{NA}	-2.5		2.5	mA
4	C	Coupling Ratio positive current injection	K_p			10^{-4}	A/A
5	C	Coupling Ratio negative current injection	K_n			10^{-2}	A/A

B.4.4 ATD accuracy (5V Range)

Table B-6 specifies the ATD conversion performance excluding any errors due to current injection, input capacitance and source resistance.

Table B-6   ATD Conversion Performance

Conditions are shown in **Table A-4** unless otherwise noted
$V_{REF} = V_{RH} - V_{RL}$ = 5.12V. Resulting to one 8 bit count = 20mV and one 10 bit count = 5mV
f_{ATDCLK} = 2.0MHz

Num	C	Rating	Symbol	Min	Typ	Max	Unit
1	P	10-Bit Resolution	LSB		5		mV
2	P	10-Bit Differential Nonlinearity	DNL	−1		1	Counts
3	P	10-Bit Integral Nonlinearity	INL	−2		2	Counts
4	P	10-Bit Absolute Error[1]	AE	-2.5		2.5	Counts
5	P	8-Bit Resolution	LSB		20		mV
6	P	8-Bit Differential Nonlinearity	DNL	−0.5		0.5	Counts
7	P	8-Bit Integral Nonlinearity	INL	−1.0	±0.5	1.0	Counts
8	P	8-Bit Absolute Error[1]	AE	-1.5	±1	1.5	Counts

NOTES:
1. These values include quantization error which is inherently 1/2 count for any A/D converter.

B.4.5 ATD accuracy (3.3V Range)

Table B-6 specifies the ATD conversion performance excluding any errors due to current injection, input capacitance and source resistance.

Table B-7   ATD Conversion Performance

Conditions are shown in **Table A-4** unless otherwise noted
$V_{REF} = V_{RH} - V_{RL}$ = 3.328V. Resulting to one 8 bit count = 13mV and one 10 bit count = 3.25mV
f_{ATDCLK} = 2.0MHz

Num	C	Rating	Symbol	Min	Typ	Max	Unit
1	P	10-Bit Resolution	LSB		3.25		mV
2	P	10-Bit Differential Nonlinearity	DNL	−1.5		1.5	Counts
3	P	10-Bit Integral Nonlinearity	INL	−3.5	±1.5	3.5	Counts
4	P	10-Bit Absolute Error[1]	AE	-5	±2.5	5	Counts
5	P	8-Bit Resolution	LSB		13		mV
6	P	8-Bit Differential Nonlinearity	DNL	−0.5		0.5	Counts
7	P	8-Bit Integral Nonlinearity	INL	−1.5	±1	1.5	Counts
8	P	8-Bit Absolute Error[1]	AE	-2.0	±1.5	2.0	Counts

NOTES:
1. These values include the quantization error which is inherently 1/2 count for any A/D converter.

For the following definitions see also **Figure B-2**.

Differential Non-Linearity (DNL) is defined as the difference between two adjacent switching steps.

$$DNL(i) = \frac{V_i - V_{i-1}}{1LSB} - 1$$

The Integral Non-Linearity (INL) is defined as the sum of all DNLs:

$$INL(n) = \sum_{i=1}^{n} DNL(i) = \frac{V_n - V_0}{1LSB} - n$$

Figure B-2 ATD Accuracy Definitions

NOTE: *Figure B-2 shows only definitions, for specification values refer to **Table B-6**.*

B.5 NVM, Flash and EEPROM

B.5.1 NVM timing

The time base for all NVM program or erase operations is derived from the oscillator. A minimum oscillator frequency f_{NVMOSC} is required for performing program or erase operations. The NVM modules do not have any means to monitor the frequency and will not prevent program or erase operation at frequencies above or below the specified minimum. Attempting to program or erase the NVM modules at a lower frequency a full program or erase transition is not assured.

The Flash program and erase operations are timed using a clock derived from the oscillator using the FCLKDIV and ECLKDIV registers respectively. The frequency of this clock must be set within the limits specified as f_{NVMOP}.

The minimum program and erase times shown in **Table B-8** are calculated for maximum f_{NVMOP} and maximum f_{bus}. The maximum times are calculated for minimum f_{NVMOP} and a f_{bus} of 2MHz.

B.5.1.1 Single Word Programming

The programming time for single word programming is dependant on the bus frequency as a well as on the frequency f_{NVMOP} and can be calculated according to the following formula.

$$t_{swpgm} = 9 \cdot \frac{1}{f_{NVMOP}} + 25 \cdot \frac{1}{f_{bus}}$$

B.5.1.2 Burst Programming

This applies only to the Flash where up to 32 words in a row can be programmed consecutively using burst programming by keeping the command pipeline filled. The time to program a consecutive word can be calculated as:

$$t_{bwpgm} = 4 \cdot \frac{1}{f_{NVMOP}} + 9 \cdot \frac{1}{f_{bus}}$$

The time to program a whole row is:

$$t_{brpgm} = t_{swpgm} + 31 \cdot t_{bwpgm}$$

Burst programming is more than 2 times faster than single word programming.

B.5.1.3 Sector Erase

Erasing a 512 byte Flash sector takes:

$$t_{era} \approx 4000 \cdot \frac{1}{f_{NVMOP}}$$

The setup times can be ignored for this operation.

B.5.1.4 Mass Erase

Erasing a NVM block takes:

$$t_{mass} \approx 20000 \cdot \frac{1}{f_{NVMOP}}$$

The setup times can be ignored for this operation.

Table B-8   NVM Timing Characteristics

Num	C	Rating	Symbol	Min	Typ	Max	Unit
Conditions are shown in **Table A-4** unless otherwise noted							
1	D	External Oscillator Clock	f_{NVMOSC}	0.5		50[1]	MHz
2	D	Bus frequency for Programming or Erase Operations	f_{NVMBUS}	1			MHz
3	D	Operating Frequency	f_{NVMOP}	150		200	kHz
4	P	Single Word Programming Time	t_{swpgm}	46[2]		74.5[3]	μs
5	D	Flash Burst Programming consecutive word	t_{bwpgm}	20.4[2]		31[3]	μs
6	D	Flash Burst Programming Time for 32 Words	t_{brpgm}	678.4[2]		1035.5[3]	μs
7	P	Sector Erase Time	t_{era}	20[4]		26.7[3]	ms
8	P	Mass Erase Time	t_{mass}	100[4]		133[3]	ms
9	D	Blank Check Time Flash per block	t_{check}	11[5]		32778[6]	t_{cyc}

NOTES:

1. Restrictions for oscillator in crystal mode apply!
2. Minimum Programming times are achieved under maximum NVM operating frequency f_{NVMOP} and maximum bus frequency f_{bus}.
3. Maximum Erase and Programming times are achieved under particular combinations of f_{NVMOP} and bus frequency f_{bus}. Refer to formulae in Sections A.3.1.1 - A.3.1.4 for guidance.
4. Minimum Erase times are achieved under maximum NVM operating frequency f_{NVMOP}.
5. Minimum time, if first word in the array is not blank
6. Maximum time to complete check on an erased block.

B.5.2 NVM Reliability

The reliability of the NVM blocks is guaranteed by stress test during qualification, constant process monitors and burn-in to screen early life failures.

The failure rates for data retention and program/erase cycling are specified at <2ppm defects over lifetime at the operating conditions noted.

A program/erase cycle is specified as two transitions of the cell value from erased → programmed → erased, $1 \rightarrow 0 \rightarrow 1$.

NOTE: *All values shown in* **Table B-9** *are target values and subject to further extensive characterization.*

Table B-9   NVM Reliability Characteristics

Num	C	Rating	Symbol	Min	Typ	Max	Unit
Conditions are shown in **Table A-4** unless otherwise noted
1	C	Data Retention at an average junction temperature of $T_{Javg} = 85°C$	t_{NVMRET}	15			Years
2	C	Flash number of Program/Erase cycles	n_{FLPE}	10,000			Cycles

Freescale Semiconductor, Inc.

B.6 Reset, Oscillator and PLL

This section summarizes the electrical characteristics of the various startup scenarios for Oscillator and Phase-Locked-Loop (PLL).

B.6.1 Startup

Table B-10 summarizes several startup characteristics explained in this section. Detailed description of the startup behavior can be found in the Clock and Reset Generator (CRG) Block User Guide.

Table B-10 Startup Characteristics

Num	C	Rating	Symbol	Min	Typ	Max	Unit
		Conditions are shown in **Table A-4** unless otherwise noted					
1	T	POR release level	V_{PORR}			2.07	V
2	T	POR assert level	V_{PORA}	0.97			V
3	D	Reset input pulse width, minimum input time	PW_{RSTL}	2			t_{osc}
4	D	Startup from Reset	n_{RST}	192		196	n_{osc}
5	D	Interrupt pulse width, $\overline{IRQ}$ edge-sensitive mode	PW_{IRQ}	20			ns
6	D	Wait recovery startup time	t_{WRS}			14	t_{cyc}

B.6.1.1 SRAM Data Retention

Provided an appropriate external reset signal is applied to the MCU, preventing the CPU from executing code when VDD5 is out of specification limits, the SRAM contents integrity is guaranteed if after the reset the PORF bit in the CRG Flags Register has not been set.

B.6.1.2 External Reset

When external reset is asserted for a time greater than PW_{RSTL} the CRG module generates an internal reset, and the CPU starts fetching the reset vector without doing a clock quality check, if there was an oscillation before reset.

B.6.1.3 Stop Recovery

Out of STOP the controller can be woken up by an external interrupt. A clock quality check as after POR is performed before releasing the clocks to the system.

B.6.1.4 Pseudo Stop and Wait Recovery

The recovery from Pseudo STOP and Wait are essentially the same since the oscillator was not stopped in both modes. The controller can be woken up by internal or external interrupts. After t_{wrs} the CPU starts fetching the interrupt vector.

B.6.2 Oscillator

The device features an internal Colpitts oscillator. By asserting the $\overline{XCLKS}$ input during reset this oscillator can be bypassed allowing the input of a square wave. Before asserting the oscillator to the internal system clocks the quality of the oscillation is checked for each start from either power-on, STOP or oscillator fail. t_{CQOUT} specifies the maximum time before switching to the internal self clock mode in case no proper oscillation is detected. The quality monitor also determines the minimum oscillator start-up time t_{UPOSC}. The device features a clock monitor. A time-out is asserted if the frequency of the incoming clock signal is below the Clock Monitor FailureAssert Frequency f_{CMFA}.

Table B-11 Oscillator Characteristics

Conditions are shown in **Table A-4** unless otherwise noted
Num	**C**	**Rating**	**Symbol**	**Min**	**Typ**	**Max**	**Unit**
1a	C	Crystal oscillator range (Colpitts)	f_{OSC}	0.5		16	MHz
1b	C	Crystal oscillator range (Pierce) [1][4]	f_{OSC}	0.5		40	MHz
2	P	Startup Current	i_{OSC}	100			µA
3	C	Oscillator start-up time (Colpitts)	t_{UPOSC}		8[2]	100[3]	ms
4	D	Clock Quality check time-out	t_{CQOUT}	0.45		2.5	s
5	P	Clock Monitor Failure Assert Frequency	f_{CMFA}	50	100	200	KHz
6	P	External square wave input frequency [4]	f_{EXT}	0.5		50	MHz
7	D	External square wave pulse width low	t_{EXTL}	9.5			ns
8	D	External square wave pulse width high	t_{EXTH}	9.5			ns
9	D	External square wave rise time	t_{EXTR}			1	ns
10	D	External square wave fall time	t_{EXTF}			1	ns
11	D	Input Capacitance (EXTAL, XTAL pins)	C_{IN}		7		pF
12	C	DC Operating Bias in Colpitts Configuration on EXTAL Pin	V_{DCBIAS}		1.1		V

NOTES:
1. Depending on the crystal a damping series resistor might be necessary
2. f_{osc} = 4MHz, C = 22pF.
3. Maximum value is for extreme cases using high Q, low frequency crystals
4. $\overline{XCLKS}$ =0 during reset

B.6.3 Phase Locked Loop

The oscillator provides the reference clock for the PLL. The PLL´s Voltage Controlled Oscillator (VCO) is also the system clock source in self clock mode.

B.6.3.1 XFC Component Selection

This section describes the selection of the XFC components to achieve a good filter characteristics.

Figure B-3 Basic PLL functional diagram

The following procedure can be used to calculate the resistance and capacitance values using typical values for K_1, f_1 and i_{ch} from **Table B-12**.

The grey boxes show the calculation for $f_{VCO} = 50MHz$ and $f_{ref} = 1MHz$. E.g., these frequencies are used for $f_{OSC} = 4MHz$ and a 25MHz bus clock.

The VCO Gain at the desired VCO frequency is approximated by:

$$K_V = K_1 \cdot e^{\frac{(f_1 - f_{vco})}{K_1 \cdot 1V}} = -100 \cdot e^{\frac{(60 - 50)}{-100}} = -90.48MHz/V$$

The phase detector relationship is given by:

$$K_\Phi = -|i_{ch}| \cdot K_V \qquad = 316.7Hz/\Omega$$

i_{ch} is the current in tracking mode.

The loop bandwidth f_C should be chosen to fulfill the Gardner's stability criteria by <u>at least</u> a factor of 10, typical values are 50. $\zeta = 0.9$ ensures a good transient response.

$$f_C < \frac{2 \cdot \zeta \cdot f_{ref}}{\pi \cdot \left(\zeta + \sqrt{1 + \zeta^2}\right)} \frac{1}{10} \rightarrow f_C < \frac{f_{ref}}{4 \cdot 10}; (\zeta = 0.9)$$
$$f_C < 25kHz$$

And finally the frequency relationship is defined as

$$n = \frac{f_{VCO}}{f_{ref}} = 2 \cdot (synr + 1) \quad \boxed{= 50}$$

With the above values the resistance can be calculated. The example is shown for a loop bandwidth f_C=10kHz:

$$R = \frac{2 \cdot \pi \cdot n \cdot f_C}{K_\Phi} \quad \boxed{= 2*\pi*50*10kHz/(316.7Hz/\Omega)=9.9k\Omega=\sim 10k\Omega}$$

The capacitance C_s can now be calculated as:

$$C_s = \frac{2 \cdot \zeta^2}{\pi \cdot f_C \cdot R} \approx \frac{0.516}{f_C \cdot R};(\zeta = 0.9) \quad \boxed{= 5.19nF =\sim 4.7nF}$$

The capacitance C_p should be chosen in the range of:

$$C_s/20 \le C_p \le C_s/10 \quad \boxed{C_p = 470pF}$$

B.6.3.2 Jitter Information

The basic functionality of the PLL is shown in **Figure B-3**. With each transition of the clock f_{cmp}, the deviation from the reference clock f_{ref} is measured and input voltage to the VCO is adjusted accordingly. The adjustment is done continuously with no abrupt changes in the clock output frequency. Noise, voltage, temperature and other factors cause slight variations in the control loop resulting in a clock jitter. This jitter affects the real minimum and maximum clock periods as illustrated in **Figure B-4**.
Figure B-4 Jitter Definitions

The relative deviation of t_{nom} is at its maximum for one clock period, and decreases towards zero for larger number of clock periods (N).

Defining the jitter as:

$$J(N) = \max\left(\left|1 - \frac{t_{max}(N)}{N \cdot t_{nom}}\right|, \left|1 - \frac{t_{min}(N)}{N \cdot t_{nom}}\right|\right)$$

For N < 100, the following equation is a good fit for the maximum jitter:
$$J(N) = \frac{j_1}{\sqrt{N}} + j_2$$

Figure B-5 Maximum bus clock jitter approximation

This is very important to notice with respect to timers, serial modules where a pre-scaler will eliminate the effect of the jitter to a large extent.

Table B-12 PLL Characteristics

Conditions are shown in **Table A-4** unless otherwise noted							
Num	**C**	**Rating**	**Symbol**	**Min**	**Typ**	**Max**	**Unit**
1	P	Self Clock Mode frequency	f_{SCM}	1		5.5	MHz
2	D	VCO locking range	f_{VCO}	8		50	MHz

NOTES:

1. t_{bus} added due to internal synchronization delay

C.3 External Bus Timing

A timing diagram of the external multiplexed-bus is illustrated in **Figure C-5** with the actual timing values shown on table **Table C-4**. All major bus signals are included in the diagram. While both a data write and data read cycle are shown, only one or the other would occur on a particular bus cycle.

C.3.1 General Muxed Bus Timing

The expanded bus timings are highly dependent on the load conditions. The timing parameters shown assume a balanced load across all outputs.

Figure C-5 General External Bus Timing

Table C-4   Expanded Bus Timing Characteristics (5V Range)

16	D	E high access time[1] ($PW_{EH}-t_{DSR}$)	t_{ACCE}	6			ns
17	D	Read/write delay time	t_{RWD}			7	ns
18	D	Read/write valid time to E rise ($PW_{EL}-t_{RWD}$)	t_{RWV}	14			ns
19	D	Read/write hold time	t_{RWH}	2			ns
20	D	Low strobe delay time	t_{LSD}			7	ns
21	D	Low strobe valid time to E rise ($PW_{EL}-t_{LSD}$)	t_{LSV}	14			ns
22	D	Low strobe hold time	t_{LSH}	2			ns
23	D	NOACC strobe delay time	t_{NOD}			7	ns
24	D	NOACC valid time to E rise ($PW_{EL}-t_{LSD}$)	t_{NOV}	14			ns
25	D	NOACC hold time	t_{NOH}	2			ns
26	D	IPIPO[1:0] delay time	t_{P0D}	2		7	ns
27	D	IPIPO[1:0] valid time to E rise ($PW_{EL}-t_{P0D}$)	t_{P0V}	11			ns
28	D	IPIPO[1:0] delay time[1] ($PW_{EH}-t_{P1V}$)	t_{P1D}	2		25	ns
29	D	IPIPO[1:0] valid time to E fall	t_{P1V}	11			ns

NOTES:
1. Affected by clock stretch: add N x t_{cyc} where N=0,1,2 or 3, depending on the number of clock stretches.

Table C-5 Expanded Bus Timing Characteristics (3.3V Range)

Conditions are VDDX=3.3V+/-10%, Junction Temperature -40°C to +140°C, C_{LOAD} = 50pF

Num	C	Rating	Symbol	Min	Typ	Max	Unit
1	P	Frequency of operation (E-clock)	f_o	0		16.0	MHz
2	P	Cycle time	t_{cyc}	62.5			ns
3	D	Pulse width, E low	PW_{EL}	30			ns
4	D	Pulse width, E high[1]	PW_{EH}	30			ns
5	D	Address delay time	t_{AD}			16	ns
6	D	Address valid time to E rise ($PW_{EL}-t_{AD}$)	t_{AV}	16			ns
7	D	Muxed address hold time	t_{MAH}	2			ns
8	D	Address hold to data valid	t_{AHDS}	7			ns
9	D	Data hold to address	t_{DHA}	2			ns
10	D	Read data setup time	t_{DSR}	15			ns
11	D	Read data hold time	t_{DHR}	0			ns
12	D	Write data delay time	t_{DDW}			15	ns
13	D	Write data hold time	t_{DHW}	2			ns
14	D	Write data setup time[1] ($PW_{EH}-t_{DDW}$)	t_{DSW}	15			ns
15	D	Address access time[1]	t_{ACCA}	29			ns
16	D	E high access time[1] ($PW_{EH}-t_{DSR}$)	t_{ACCE}	15			ns
17	D	Read/write delay time	t_{RWD}			14	ns
18	D	Read/write valid time to E rise ($PW_{EL}-t_{RWD}$)	t_{RWV}	16			ns
19	D	Read/write hold time	t_{RWH}	2			ns
20	D	Low strobe delay time	t_{LSD}			14	ns
21	D	Low strobe valid time to E rise ($PW_{EL}-t_{LSD}$)	t_{LSV}	16			ns
22	D	Low strobe hold time	t_{LSH}	2			ns
23	D	NOACC strobe delay time	t_{NOD}			14	ns
24	D	NOACC valid time to E rise ($PW_{EL}-t_{LSD}$)	t_{NOV}	16			ns
25	D	NOACC hold time	t_{NOH}	2			ns
26	D	IPIPO[1:0] delay time	t_{P0D}	2		14	ns
27	D	IPIPO[1:0] valid time to E rise ($PW_{EL}-t_{P0D}$)	t_{P0V}	16			ns
28	D	IPIPO[1:0] delay time[1]	t_{P1D}	2		25	ns
29	D	IPIPO[1:0] valid time to E fall	t_{P1V}	11			ns

NOTES:

1. Affected by clock stretch: add N x t_{cyc} where N=0,1,2 or 3, depending on the number of clock stretches.

Freescale Semiconductor, Inc.

Appendix D Package Information

D.1 General

This section provides the physical dimensions of the MC9S12C32 packages 48LQFP, 52LQFP, 80QFP.
D.2 80-pin QFP package

NOTES:
1. DIMENSIONING AND TOLERANCING PER ANSI Y14.5M, 1982.
2. CONTROLLING DIMENSION: MILLIMETER.
3. DATUM PLANE -H- IS LOCATED AT BOTTOM OF LEAD AND IS COINCIDENT WITH THE LEAD WHERE THE LEAD EXITS THE PLASTIC BODY AT THE BOTTOM OF THE PARTING LINE.
4. DATUMS -A-, -B- AND -D- TO BE DETERMINED AT DATUM PLANE -H-.
5. DIMENSIONS S AND V TO BE DETERMINED AT SEATING PLANE -C-.
6. DIMENSIONS A AND B DO NOT INCLUDE MOLD PROTRUSION. ALLOWABLE PROTRUSION IS 0.25 PER SIDE. DIMENSIONS A AND B DO INCLUDE MOLD MISMATCH AND ARE DETERMINED AT DATUM PLANE -H-.
7. DIMENSION D DOES NOT INCLUDE DAMBAR PROTRUSION. ALLOWABLE DAMBAR PROTRUSION SHALL BE 0.08 TOTAL IN EXCESS OF THE D DIMENSION AT MAXIMUM MATERIAL CONDITION. DAMBAR CANNOT BE LOCATED ON THE LOWER RADIUS OR THE FOOT.

| DIM	MILLIMETERS

D.3 52-pin LQFP package

**Figure D-2 52-pin LQFP Mechanical Dimensions (case no. 848D-03)**

NOTES:
1. DIMENSIONING AND TOLERANCING PER ANSI Y14.5M, 1982.
2. CONTROLLING DIMENSION: MILLIMETER
3. DATUM PLANE -H- IS LOCATED AT BOTTOM OF LEAD AND IS COINCIDENT WITH THE LEAD WHERE THE LEAD EXITS THE PLASTIC BODY AT THE BOTTOM OF THE PARTING LINE.
4. DATUMS -L-, -M- AND -N- TO BE DETERMINED AT DATUM PLANE -H-.
5. DIMENSIONS S AND V TO BE DETERMINED AT SEATING PLANE -T-.
6. DIMENSIONS A AND B DO NOT INCLUDE MOLD PROTRUSION. ALLOWABLE PROTRUSION IS 0.25 (0.010) PER SIDE. DIMENSIONS A AND B DO INCLUDE MOLD MISMATCH AND ARE DETERMINED AT DATUM PLANE -H-
7. DIMENSION D DOES NOT INCLUDE DAMBAR PROTRUSION. DAMBAR PROTRUSION SHALL NOT CAUSE THE LEAD WIDTH TO EXCEED 0.46 (0.018). MINIMUM SPACE BETWEEN PROTRUSION AND ADJACENT LEAD OR PROTRUSION 0.07 (0.003).

D.4 48-pin LQFP package

NOTES:
1. DIMENSIONING AND TOLERANCING PER ASME Y14.5M, 1994.
1. CONTROLLING DIMENSION: MILLIMETER.
2. DATUM PLANE AB IS LOCATED AT BOTTOM OF LEAD AND IS COINCIDENT WITH THE LEAD WHERE THE LEAD EXITS THE PLASTIC BODY AT THE BOTTOM OF THE PARTING LINE.
3. DATUMS T, U, AND Z TO BE DETERMINED AT DATUM PLANE AB.
4. DIMENSIONS S AND V TO BE DETERMINED AT SEATING PLANE AC.
5. DIMENSIONS A AND B DO NOT INCLUDE MOLD PROTRUSION. ALLOWABLE PROTRUSION IS 0.250 PER SIDE. DIMENSIONS A AND B DO INCLUDE MOLD MISMATCH AND ARE DETERMINED AT DATUM PLANE AB.
6. DIMENSION D DOES NOT INCLUDE DAMBAR PROTRUSION. DAMBAR PROTRUSION SHALL NOT CAUSE THE D DIMENSION TO EXCEED 0.350.
7. MINIMUM SOLDER PLATE THICKNESS SHALL BE 0.0076.
8. EXACT SHAPE OF EACH CORNER IS OPTIONAL.
